[O] Twenty-one experiments are already costed in the curriculum and are not repeated here. The falsifiers above are the thematic layer above them: where a protocol tests a claim, a falsifier tests a theme, and a theme can survive a failed protocol but not a failed falsifier.

The chapter arc

[F] Ordered by the arc rather than by the argument, the corpus falls into nine Parts and forty-four chapters. This is not a reorganization of the existing works — the curriculum teaches the volume in the order a learner needs, and the volume argues in the order the case needs. This is the third ordering: the order in which the events happened. Each Part below carries the themes that are live in it. [VOL p.458] **part title Part One The Instrument Part Two The Elements, in the Order They Were Made Part Three The Chemistry Before the Planet Part Four Mineral, Gradient, Cluster Part Five The Monomers and the Trunk themes T3 T13 T9 T11 T5 T11 T7 T12 T1 T11 T5 T2 T6 T12 chapters What a notation is · Base, nucleoside, nucleotide · The five losses · Color as a measurement · What this book refuses Hydrogen and the weak bond · Carbon, nitrogen, oxygen ·**

Sulfur and phosphorus · Selenium, last and least · The seven as a spectrum The amide bond in the cloud · The delivered inventory · Handedness, delivered · What availability does and does not establish Serpentinization and the alkaline field · Mackinawite and greigite · The cubane before the protein · Lost City, in the present tense Cyanide, sulfide and ultraviolet light · The trunk and its two branches · The gates on either side · The backbone that was not taken part title Part Six Polymers, Errors and the Fixing of the Code Part The Enzyme That Made Seven DNA, and the Oxygen Boundary themes T8 T7 T3 T4 T1 T9 chapters The first copying error · Thioester energy, cluster electrons · Charging and the adaptor · Position thirty-four · Twenty-two, not twenty · What froze, and when A radical on a cysteine · Biology proceeds by removal · The anomaly that stops · Nine sulfurs to two · What sulfur kept Part Eight Compartments, Marks and T1 T4 T8 T11 The endosymbiont that stayed · Two currencies, one the Editor element · The repeat and the duplex · The mark of self · **Read as guanosine**

[F] Read down the themes column and the shape of the book is visible: the instrument first, then eight Parts in which the chemistry decides things, then the record and the clinic last. The notation argument opens and closes it, and in between it is absent for five Parts — which is the right proportion, because the notation only becomes a problem once there is something to name.

[O] Forty-four chapters at the length the corpus writes them is a volume of several hundred pages, and the material for most of them exists. What does not yet exist is the cellular Part at the depth the others have, and the four plates the sulfur book needs.

Status. The thematic volume of the corpus. Every line item in the record as of 17 October 2026 — 2300 of them across fourteen sources — was classified against thirteen themes by a stated keyword rule; the assignment, the unassigned remainder and the per-theme registers are printed in full so that the classification can be checked and re-run. The arc of twelve stages is dated by

Part IX — Collisions, falsifiers, and the chapter arc

Where the themes collide

[E] Themes that never disagree are a classification scheme rather than an argument. Six places where two of the thirteen pull against each other, with what the collision settles and what it leaves open.

<a href="#t-T2">T2</a> against <a href="#t-T12">T12</a> — If abundance does not make a base a letter, why should metabolic priority?

The two themes are in tension by construction, and the tension is productive. The twelfth says availability is not membership; the second says the trunk comes first. If the second rested on how much inosine there is, the twelfth would demolish it. It does not: it rests on the route — that no organism reaches either branch without passing the trunk — and a route is a structural fact rather than a quantity. The corpus should state the second theme in route terms

Source page [THEMES p.179] rendered at 150 dpi (plate / figure / table as published).

[THEMES p.180] every time it states it, and in several places it states it in abundance terms instead.

<a href="#t-T3">T3</a> against <a href="#t-T13">T13</a> — Is the notation argument held to the corpus's own standard of refusal?

The third theme says the record cannot hold what the chemistry does. The standing objection is that modification databases do hold it. The corpus concedes that the objection is also the admission — the clinic reads the sequence file — and that concession is the thirteenth theme operating on the third. The collision is resolved honestly, and it is the model for how the other twelve should be handled.

<a href="#t-T5">T5</a> against <a href="#t-T7">T7</a> — If arrangement carries the information, why is the carrier so weak?

Because an arrangement that cannot change cannot be read twice. The fifth theme is the condition of the seventh rather than its competitor: a bond strong enough to fix an arrangement permanently would make the arrangement unreadable, and a system with no fixed arrangement at all would have nothing to read. The interesting regime is the narrow one between, and that regime is set by the hydrogen bond.

<a href="#t-T1">T1</a> against <a href="#t-T9">T9</a> — Does the nine-to-two result generalize, or is it one cofactor?

The first theme wants the collapse to be a general consequence of the oxygen boundary; the ninth theme's method requires that a count change across one boundary in one direction and stay changed. One family satisfies that. Until the structural survey is run across families with pre- and post-oxidation representatives, the first theme is supported by a case and not by a law, and the corpus says so in the paragraph that makes the claim.

<a href="#t-T3">T3</a> against <a href="#t-T10">T10</a> — Is the problem the alphabet or the dimensionality?

These are separable and the corpus sometimes runs them together. A record could carry every modification and still be flat; a three-dimensional model could be built on four letters. The cleanest statement is that the third theme is about what is representable and the tenth is about what is computable from a representation, and that the clinical consequences the corpus names fall into two piles accordingly.

<a href="#t-T4">T4</a> against <a href="#t-T8">T8</a> — Is editing a removal or a repurposed damage?

Both, and the two themes are two descriptions of one event. The fourth says the category is made by taking something away; the eighth says the sign of the event is set by where it [THEMES p.181] happens. Together they make a prediction neither makes alone: that the enzymes of editing should be evolutionarily continuous with the enzymes of repair and modification, and that the compartment rather than the chemistry should predict which one you are looking at.

The falsifier index

[E] Every way of being wrong that the thirteen themes generate, numbered, with the theme it would break and the class of work it needs. Nothing here has been done.

no.	theme	what would break it	class
1	T1	Find a cellular electron-transfer system of comparable antiquity that runs without sulfur ligation at any point.	no bench
2	T1	Show that the sulfur share of element mentions falls to the level of other elements when the same mechanical count is run on a control document by someone who has not read the corpus.	no bench
3	T1	Date a pre-oxygen cofactor family whose sulfur count rises rather than falls across the boundary.	bench
4	T2	Demonstrate a route to adenine or guanine nucleotides in any organism that does not pass through the trunk.	bench
5	T2	Show that the prebiotic and metabolic priorities are artifacts of the conditions chosen — that a defensible set of early-Earth conditions reaches the canonical purines first.	no bench
6	T2	Show that the base at the first anticodon position could be any purine, by building an adaptor that widens its reading the same way without it.	no bench

9	T3	Show that the three named operational cases do not hold — that the trial, the call and the drug were not constrained by the record.	clinical
10	T4	Find an organism that assembles a deoxyribonucleotide from a pre-made deoxy sugar rather than by reduction.	no bench
11	T4	Show that prebiotic removal of the 2′ oxygen does not require sulfur chemistry in the way the enzyme does.	no bench
12	T4	Name a category-making step in the central chain that is an addition rather than a removal.	no bench
13	T5	Show a decoding or replication system of comparable fidelity built on bonds an order of magnitude stronger.	bench
14	T5	Show that pairing strength does not predict which regions of a genome open first.	no bench

[THEMES p.182]

no.	theme	what would break it	class

15	T5	Show that the editor can reach a site independent of whether the duplex opens.	no bench
16	T6	Find a committed step in purine metabolism with no pharmacology on it and no regulation at it.	no bench
17	T6	Show that drug efficacy on this pathway is independent of whether the target step is reversible.	no bench
18	T6	Show a gate the corpus names that is in fact reversible under physiological conditions.	bench
19	T7	Show a decoding system of comparable specificity built on two points of contact.	bench
20	T7	Show that the two mirror forms of a modified backbone are functionally equivalent in the systems the corpus names.	no bench
21	T7	Score the arrangement claims against the volume’s own four conditions and find one that passes where the corpus says it fails.	no bench
22	T8	Find an editing system whose chemistry has no damage counterpart anywhere in the same cell.	no bench
23	T8	Show that the editor is not evolutionarily related to the repair or modification enzymes it resembles.	no bench
24	T8	Show a case where the sign of the outcome is set by the chemistry rather than by the compartment.	bench
25	T9	Run the ligation-count survey and find no systematic direction of change.	no bench
26	T9	Find a biological element with a wider span of oxidation states in use.	no bench
27	T9	Date a cofactor family whose sulfur count changes more than once.	bench
28	T10	Show that approved and failed antisense sites do not differ in ensemble accessibility.	no bench
29	T10	Show a commercial pipeline that already models accessibility in the way the corpus says is missing.	no bench
30	T10	Show that the flat representation loses nothing a working method needs.	no bench
31	T11	Show a cofactor whose nucleotide handle is required by its chemistry.	bench

32	T11	Show that the cluster motifs in modern proteins are not mineral-like in structure.	no b enc h
33	T11	Show that the editor’s substrates are not dominated by the repeat family the corpus names.	no b enc h
34	T12	Show that code membership tracks prebiotic abundance across the five canonical bases.	no b enc h
35	T12	Show that the alternative backbone fails on a chemical ground rather than on a historical one.	no b enc h
36	T12	Show that the eight of manufacture and the set that is read are the same set.	no b enc h

[THEMES p.183]

no.	the me	what would break it	clas s
37	T13	Find a claim in the corpus that is held without a stated condition under which it would be wrong.	no b enc h
38	T13	Show that a refused shape in fact satisfies the conditions the volume set for it.	no b enc h
39	T13	Show that the dispute register omits a live dispute the corpus’s own material raises.	no b enc h

[F] 39 falsifiers: 30 no bench, 8 bench, 1 clinical. The majority need no bench at all — they are run against public structures, published pipelines, the corpus’s own tables, or an afternoon with a database. That ratio is the useful fact in this Part: a body of work of this size that can be attacked this cheaply is worth attacking.

[O] Twenty-one experiments are already costed in the curriculum and are not repeated here.

The falsifiers above are the thematic layer above them: where a protocol tests a claim, a falsifier tests a theme, and a theme can survive a failed protocol but not a failed falsifier.

The chapter arc

[F] Ordered by the arc rather than by the argument, the corpus falls into nine Parts and forty-four chapters. This is not a reorganization of the existing works — the curriculum teaches the volume in the order a learner needs, and the volume argues in the order the case needs. This is the third ordering: the order in which the events happened. Each Part below carries the themes that are live in it.

[F] Read down the themes column and the shape of the book is visible: the instrument first, then eight Parts in which the chemistry decides things, then the record and the clinic last. The notation argument opens and closes it, and in between it is absent for five Parts — which is the right proportion, because the notation only becomes a problem once there is something to name.

[O] Forty-four chapters at the length the corpus writes them is a volume of several hundred pages, and the material for most of them exists. What does not yet exist is the cellular Part at the depth the others have, and the four plates the sulfur book

needs.

Status. The thematic volume of the corpus. Every line item in the record as of 17 October 2026 — 2300 of them across fourteen sources — was classified against thirteen themes by a stated keyword rule; the assignment, the unassigned remainder and the per-theme registers are printed in full so that the classification can be checked and re-run. The arc of twelve stages is dated by chemistry and anchored to named items in the record. The themes are stated as claims, traced along the arc, set against one another where they collide, and closed with 39 falsifiers, the majority of which need no bench. The concordance of Part VII carries every item alphabetically and is the volume's index to itself; the color registers of Part VIII are its second index, by element. Every colored word, theme code, arc stage and register entry in this book is a live link, and the whole is bookmarked by Part and section.

Part XI — What the enlarged record establishes

31. The arithmetic of the revision

where	what is enumerated	items
Part III	file lines in the photographed folder	361
Part VI	documents entered into the record	13
Part VII	documents in the May index	22
Part VII	rows of the axis table, and active priorities	7
Part VII	documents in the June index	204
Part VII	documents in the overview running order, and their descriptions	42
Part VII	subjects in the 816 subject index	188
Part VII	subjects in the 816 master subject index	1,063
Part VII	index entries reproduced from v329	42
Part VII	numbered functions of sulfur	34
Part VII	hero plates, structural groups and plate gaps	24
Part VIII	Parts and chapters of the curriculum	70
Part VIII	protocols, disputes, coverage rows and recorded omissions	50
Part VIII	chapters of the sulfur outline, and the six chapter elements	40
Part VIII	chapters of the atomic molecular book, and the seed table	17

Part VIII	Parts and sections of the central-dogma paper	35
Part VIII	chapters of the memoir, with its preface	15
Part IX	enumerations set side by side, and units of enumeration	19
Part IX	corpus-level figures, and indexes named but not yet entered	31
Part X	concepts, terms and phrases registered	161

[F] The paper as it now reads enumerates 2,438 line items. 377 of them are files in one folder; the rest are documents, subjects, index entries, plates, chapters, sections, protocols, disputes and terms. Every one of them is traceable to a document named in [INV p.88] Part VI, and every count in this paper is reproducible from the listings themselves.

32. What the thirteen documents establish that the folder listing could not

[E] The corpus is larger than one folder by an order of magnitude, and the figure is not an estimate: 6,600 files and 20.37 GB, taken from a photographed file tree on 16 August 2026.

[E] The work has a finished object at its center. A volume of 2,572 pages in 169 Parts and 1,753 numbered sections exists, is indexed to section and page, and has a 185-page companion volume with two subject indexes of its own.

[E] The indexing is habitual rather than occasional. Ten enumerations in five months, in five different units, with fourteen more named and not yet entered. Three of the ten were built by photographing a drive or a window rather than by recollection, which is why their figures can be checked.

[F] The work is teachable, and the teaching apparatus was built before any reader asked for it. Sixty chapters in ten Parts, twenty-one costed protocols, fourteen contested positions with the corpus’s own standing on each, and a coverage map stating what is carried and what is held back. A corpus that prints its own dispute register is being offered for testing rather than for assent.

[F] The frontier is counted. 903 of 1,063 named subjects stand in the corpus and outside the volume; four chapters of the sulfur book have no plate yet; eleven of the twenty-one protocols need no bench at all. The record states what is done, what is next, and what it would cost — in that order, and in numbers.

[E] The vocabulary is stable. 161 named concepts, terms and phrases run across thirteen documents in four different forms, each used in the same sense wherever it appears.

[O] What the enlarged record still does not reach is the standing of any single claim. An inventory can establish that the work exists, at what scale, in what order, with what apparatus and against what objections. Whether the central proposal is right is settled by the twenty-one protocols and not by this paper, and the register of them is the useful part of this revision for anyone who intends to find out.

Status. Revision 2 of the corpus inventory. Parts I to V stand as first written, with the listing of Part III reproduced from the transcription of fifteen photographs taken 15 October 2026. Parts VI to XI are new and cover the thirteen documents handed over on 16 October 2026, in fourteen files, one of which is a duplicate. Every index is reproduced in its own unit of [INV p.89] enumeration; every chapter-length work is opened to its own contents; the indexes are then set against one another in Part IX and the vocabulary registered in Part X. Counts are computed from the listings printed here and are reproducible from them. Truncated file names are reproduced as the Finder displayed them and have not been reconstructed. Where a document states its own extent, that statement is used in preference to any count taken from an earlier state of the same object.

13. Consolidated registers, indexes and concordance

13.1 Theme registers [THEMES Part VI]

[THEMES p.36]

source	where to read	why it sits here
CURR	A4 · What the Notation Loses	the five losses, named once
CDU	§18 · The Complete Base-Pairing Rule Set	every relationship the paper recognizes, in one table
CURR	F31 · The Wobble Position	what one position decides about the whole code
CURR	H47 · Read as Guanosine	the instrument writing the wrong letter, and the consequence
CURR	G38 · The Sequence Has No Shape	the design method and what it is not seeing
SCN	D17 · Twenty-Two Amino Acids, No Repeats	what happens to degeneracy when the alphabet is eight
CURR	J58 · Supply Is Not Repertoire	the discipline applied against the corpus's own case

Part VI — The theme registers

[E] Every item the classification assigned to a theme, listed under that theme, with its source tag. An item appearing under four themes is printed under all four. Each entry links to its place in the A to Z concordance, where its reference line and its colors are carried.

[F] These registers are the evidence for Part III. A theme whose register is drawn from one source is a theme of one document; a theme whose register runs across the subject indexes, the plates, the chapters and the file listing is a theme of the corpus. Eleven of the thirteen are the second kind.

Part VII — The A to Z concordance

[E] Every line item in the record, alphabetically, with the themes it carries, the elements it names, and the source it comes from. Leading articles are ignored in the sort. Theme codes link to Part III; element names carry their color and link to the registers in Part VIII; each entry is itself a destination, linked to from the theme registers of Part VI.

[F] This is the literal answer to the question of what is in the corpus. It is not a summary of the record and not a selection from it: 2300 entries, every one of them taken from a document named in the inventory, each carried here with what it holds rather than with where it was filed.

The letters

55 · A 174 · B 381 · C 135 · D 104 · E 73 · F 59 · G 89 · H 50 · I 70 · J 4 · K 21 · L 39 · M 73 · N 76 · O 41 · P 294 · Q 44 · R 69 · S 205 · T 141 · U 19 · V 21 · W 40 · X 6 · Y 5 · Z 12

Part VIII — The color registers

[E] The color scheme is the corpus's second index. An element is marked wherever it occurs — free, as a base, as a nucleotide, or inside any larger molecule — so the register of a color is a register of one chemistry across the whole record. Every colored word anywhere in this book links to the register below.

[F] The registers are unequal and the inequality is the finding. Sulfur's register is the largest of the seven by a wide margin, and oxygen's — which is to say inosine's — is second. Those two colors are the corpus's subject, and the mechanical count says so without being asked, because the convention marks elements whether or not the author was arguing about them at the time.

color	element and base	items	what the register holds
red	hydrogen · adenine	36	The donor and the weak bond; the base that is in everything because it was once RNA; the handle on every cofactor.
blue	carbon · cytosine	7	The skeleton every group is built on, and the base whose deamination is the reason DNA flags uracil.
green	nitrogen · guanine	19	The lone pair that makes a base a base; the strong pair; the element nitrogenase fixes with nine sulfurs.
orange	oxygen · hypoxanthine · inosine	87	The hardest acceptor, and the trunk nucleotide that carries its carbonyl — the two most consequential appearances of one element in this corpus.
purple	phosphorus · uracil	14	The linker that stays put, and the base the gate on the pyrimidine side delivers.
yellow	sulfur · thymine	145	Nine oxidation states, the radical that made DNA, the thioester, the sulfonium, the disulfide switch — and the largest register of the seven.
indigo	selenium · xanthine · orotate	27	The band the eye does not resolve; the element kept separate from sulfur on purpose; the two gatekeepers.

[THEMES p.173] ## The red register — hydrogen · H 1 — 36 items

13.4 The indexes, item by item [INV Part VII]

PP-2026-VTI-01 · NovagonDNA · © 2026 Dr. John Allen Berger, PhD · CC BY-NC-ND 4.0

[INV p.26] **[E]** The color key prints in full and records that a life carries no row and therefore no color — the convention operating as intended rather than an omission. Three rows do carry a role: adenosine in Chapter Fourteen, inosine and the wobble position in Chapter Twelve, the phosphorothioate backbone in Chapter Fourteen.

[F] It is the only document in the record whose unit of enumeration is a year rather than a file, and the only one that dates the work's resumption: April 2025, and the chapter titled Resurrection.

Part VII — The indexes, item by item

[E] Seven indexes are reproduced below in their own units. Nothing is summarized away: where an index numbers its items, the numbers are kept; where it marks an item as standing outside the volume, the mark is kept.

14. The Master Document Index, May 2026 — 22 documents

The axis table the index prints at its head, marked never to be modified.

axis		numbers	molecule	function	
X-Axis		3–6–9	DNA	past / structural / template	
Y-Axis		1–5–7	RNA	present / operational / transcription	
Z-Axis		2–4–8	ANA (arabino nucleic acid)	future / selector / gene editing	
no.	**document**			**date**	**category**
1	Berger Triplex Genetic Code — Formal Closure Document			21 Apr 2026	Core framework

2	Berger Triplex 369 — System Architecture			21 Apr 2026	Core framework
3	Berger Tensor Triplex — Quaternion Architecture			Apr 2026	Core framework
4	Berger Triplex Genetic Code — Seven Impact Domains			22 Apr 2026	Core framework
5	Bacterial Model — Probiotic / Postbiotic / Parabiotic			Apr 2026	Core framework

6	Berger Triplex — 3-6-9 Vortex Fractal Extension			May 2026	Mathematical and geometric
7	Berger Triplex — Quaternion 3D Architecture			May 2026	Mathematical and geometric

[INV p.27]

no.	document	date	category
8	Gravity as Primordial Origin — Triangle / Incircle Position Paper	May 2026	Mathematical and geometric
9	Drain / Exhale Duality — Gravity and the Three Forces	May 2026	Mathematical and geometric
10	ANA Argonne Letter, Cyanobacteria — APS 19-ID team	29 Apr 2026	Outreach letter

[F] The index's own closing line, dated 18 June 2026, reads: this completes the beginning.

Four next steps follow it — organize the papers into seven thematic chapters, deposit the whole set for citation, build a searchable online index, and submit the formal papers to a preprint server.

16. The Overview Papers Index and Running Order — 21 documents

In the reading order the index prescribes, with the function each document serves.

no.	document	identifier	date	function	axis
1	Decoding the Universe — Sample Edition (contents and Chapter One)	trade book	2026	front door — reader entry	all
2	The Berger Triplex 3-6-9 Framework — A 25-Year Synthesis	framework preface	Jun 2026	decoder key — X/Y/Z	all
3	Master Domain Scaffold and Corpus Architecture	scaffold	Jun 2026	corpus map — structure	four domains
4	Corpus Organizer — Unified Cosmic Storyline	organizer	27 Jun 2026	corpus map — timeline	X/Y/Z and the seventh
5	Master Outline — Big Bang to Murchison to consciousness	master outline	2026	corpus map — chronological	X→Y→Z
6	Chapter Assignment Map	book architecture	2026	corpus map — files to chapters	all
7	A Formal Methodology Paper	methodology	May 2026	how it was built	all
8	The Epistemic Architecture Across All Four Domains	PP-2026-DECODE-EPISTEMIC-01	30 Jun 2026	credibility — the standard	meta
9	A Full-Corpus Epistemic Audit of the Master Scaffold	PP-2026-DECODE-EPISTEMIC-01	30 Jun 2026	credibility — standard applied	meta
10	Berger Triplex Corpus — Fact-Check Registry, Batch 3	QA registry	Jul 2026	credibility — granular	meta
11	Mission Fault Logic Controller	process controller	2026	credibility — process	governance
12	A Comprehensive Synthesis of the Literature on Inosine, v12	inosine synthesis	15 Jul 2026	flagship — established science	Y (RNA)

13	The Triplex Storyboard, revised	PP-2026-STORYBOARD-TRIPLEX-01	~28 Jun 2026	synthesis — the hand-drawn maps	all

[INV p.33]

no.	document	identifier	date	function	axis
14	Master Unified Document — Capstone Introduction	master unified doc	2026	capstone	all and the seventh
15	The Berger Spinor — Topology, Arithmetic, and Scales of Coherence	PP-2026-SPIN-8-01	22 Jun 2026	frontier — develop further	geometry
16	The Berger Vortex Engine — Seven-Agent Hive Framework	Vortex Engine	2026	frontier — develop further	all
17	Addendum B — The Loop Geometry of Life	PP-2026-ATPS-01-A DD-B	24 Jun 2026	deep dive	geometry
18	Addendum C — The Cosmic Arc of Human Life	PP-2026-ATPS-01-A DD-C	24 Jun 2026	deep dive	X/Y/Z
19	Addendum D — The Neural Arc	PP-2026-ATPS-01-A DD-D	24 Jun 2026	deep dive	Z
20	Addendum E — The Gamete Arc	PP-2026-ATPS-01-A DD-E	24 Jun 2026	deep dive	Z
21	Complete Connection Map — Berger Triplex and Dispenza	connection map	Apr 2026	application	X/Y/Z
The one-line description each row carries.					
1.	Full contents, 7 parts and 21 chapters, with Chapter One				
2.	Preface and three-axis key: X=DNA=past, Y=RNA=present, Z=ANA=future				
3.	Quantum physics, prebiotic RNA Earth, genetic code deep dive, doomsday clock				

4.	Seven cosmic epochs across 13.8 billion years, and five interweaving threads				
5.	The book in true chronological order, read through three lenses				
6.	Sorts corpus files into the 21 chapters and proposes five more				
7.	Six-discipline construction method; the framework closed 21 April 2026				
8.	Five-category standard; 103 claims; six falsifiable predictions				
9.	Audit by category across the whole scaffold				
10.	Per-document check of names and identifiers				
11.	A 63-step launch sequence and a three-law fault protocol at six sigma				
12.	Inosine, hypoxanthine, xanthine and IMP, tied to the inosine thesis				
13.	Reconstructs the six sheets; the inner ring reads A, U, G, C, I, X				
14.	Adds finance as a silent seventh discipline; value, science and reality as one				
15.	A 25-node nested hexagon; closure at six, apex at nine; scale invariance				
16.	Seven agents named for the seven questions; a carbon-silicon chip hypothesis				

[INV p.34]

17.	Probability, origami, shell creatures, protein folding, mathematics before matter
18.	State and trait, nature and nurture, gestation and development on the three axes
19.	Neural tube to consciousness; ion channels; the quaternion brain
20.	Egg, sperm, fertilization — the loop closing and opening
21.	The three axes mapped onto a past/present/future model

Items 17 and 18, the 816 Subject Matter Index and the 816 Master Subject Matter Index, are in the Combined Register of the Berger 816 Subjects, page R-1.

Items 17 and 18, the 816 Subject Matter Index and the 816 Master Subject Matter Index, are in the Combined Register of the Berger 816 Subjects, page R-1.

19. The index to the full-length volume, v329 — the head of 812 entries

Each entry carries a primary section, its secondary sections in order — capped at twelve, with the remainder counted — and its pages in the printed edition. The 42 entries below are the head of the index as it stands, from 2-aminoadenine to alphabet; the pages are volume pages 1,714 to 1,718.

[INV p.61]

entry	primary	secondary sections
2-aminoadenine	§18	§33, §41, §65, §133, §857, §860 120, 122, 152, 185, 252, 262, 334,
2-selenouridine	§432	§437 645, 648
2-thiocytidine	§435	§698, §1610, §1709 647, 913, 1575, 1637
2-thiouridine	§24	§31, §33, §38, §40, §41, §54, 75, 134, 142, 151-152, 162, 171,
3.6 residues	§347	— 576
7SK RNA	§333	— 564
7SL RNA	§333	§334, §1491, §1497, §1501 564-565, 1477, 1481, 1483
A-site	§170	§294, §299, §311, §315, §319, 392, 529, 534, 545, 548, 552, 614,
A-to-I	§41	§133, §183, §200, §267, §295, 76-77, 91, 182, 348, 401, 420,
acclimation	§481	§488, §490 685, 690, 692
acetyl-CoA	§36	§37, §40, §46, §52, §53, §122, 71, 82, 91, 159, 161, 172, 201,
acrylonitrile	§329	§330, §340, §341, §581 560-561, 570-571, 780
acute myeloid leukemia	§119	§294 318, 529
ADAR	§303	§15, §24, §30, §31, §41, §119, 77, 91, 113-114, 134, 141-142,
ADAR1	§303	§291, §293, §296, §299, §300, 77, 526, 528, 531, 534-539,
ADAR2	§133	§291, §292, §293, §299, §301, 340, 346, 356, 359, 526-528, 534,
ADAR3	§291	§303, §356, §361, §362, §363, 526, 538, 582, 587-589, 595, 597,
ADARB1	§382	§383, §385, §387, §388, §407, 604-605, 607, 609-610, 625, 629,
Adarb1	§382	§383, §385, §387, §388, §407, 604-605, 607, 609-610, 625, 629,
Adarb2	§475	— 680
ADAT	§370	§31, §133, §281, §356, §361, 77, 79, 142, 346, 356, 517, 582,
ADAT1	§369	§1572 594, 1546

20. The Sulfur Archive Plate Index — 116 plates

The 34 numbered functions of sulfur, Plate 072

Items 1 to 5 are cosmochemistry and mineralogy; 6 to 16 are biology, ascending; 17 and 32 to 34 are physics. The list crosses every scale, in order, without a break.

1. Sulfur interstellar space compounds
2. Sulfur atomic isotopes
3. Sulfur organic compounds
4. Sulfur mineral sulfates
5. Sulfur crystalline molecular structures
6. Sulfur green bacteria
7. Sulfur organic life colonies
8. Sulfur colony genes, family functions
9. Sulfur chromosomes
10. Sulfur thalamus switching functions

11. Disulfide photochemical interface switch
12. Sulfur hormones
13. Sulfur medicines
14. Sulfur purple bacteria
18. Sulfur vitamins
19. Sulfur DNA and RNA
20. Sulfur amino acids
21. Sulfur proteins
22. Sulfur enzymes
23. Sulfur oxidation states
24. Sulfur neurotransmitters
25. Sulfur nucleotides
26. Sulfur inorganic compounds
27. Sulfur mineral sulfosalts
28. Sulfur mineral sulfides
29. Sulfur volcanic bombs
30. Sulfur universal chemical primer
31. Sulfur universal genetic primer

[INV p.63]

15. Chromatium			32. Sulfur color and heat absorption proteins
16. Glucose energy producers			33. Sulfur sine wavelet generators
17. Sulfur prismatic photon color parser			34. Sulfur selenium silicon superconductor triode
The 13 hero plates			
plate	**what it carries**		
072	The 34 numbered functions of sulfur — the spine, and the archive's own table of contents		

037	Sulfur — Roots, Survival, Future. Chief Executive Officer, Organic Chemistry Inc., over a periodic table		
015	Purines: inosine the parent, a denosine child one, guanosine child two — and what the omission of the parent would cause		
112	The Missing Genetic Code — a full node-and-edge network from start to extinction		
099	Purine-metabolism defects, with molybdenum cofactor deficiency as the row where the channels collide		

019 / 025	Sulfur — Human Genome Super String; the respiratory chain across the inner membrane		
116	The sulfur cycle: Thiobacillus, Desulfovibrio, hydrogen sulfide, sulfate, mineral sulfur		
095	Chromatium vinosum among iron-sulfur protein, ferredoxin, cytochrome, ATP and sulfur — the 1997 work as a graph		
087 / 088	Ferroelectric crystals, with a protein empirical formula in which the sulfur is counted		

064 / 065	Sulfur protein photonic color helical strings; atom-photon interactions		
084 / 110	Biological environment and element availability — volt-equivalent against oxidation state at pH 7, sulfur spanning the full width		
033	A hand-drawn motor patent overlaid with the visible spectrum and the elements of life — the seven-color key in its raw form		
The 8 structural groups			
group		**plates**	
Cosmochemistry and		006, 009, 010, 011, 012, 036, 052, 059, 061, 076, 081, 086, 090, 109, 114 —	

prebiotic		interstellar molecules, cometary molecules, the magma ocean, iron sulfide	
Element and periodic table		022, 026, 035, 037, 039, 040, 084, 085, 086, 089, 097, 098, 110 — atomic elements in the human genome, sulfur ranked seventh	
Purine m etabolism and		014, 015, 027, 030, 031, 049, 050, 054, 055, 057, 062, 063, 073, 101, 103, 105,	
inosine		107 — de novo against salvage, IMP to XMP, AMP and GMP	

13.5 The index of the indexes [INV Part IX]

[INV p.74] **[E]** The thirteenth document is this paper's own first revision. Its line items are reproduced in Part III above, in date order, and are not repeated here. Its own enumeration stands: 377 files, 328 authored, 49 reference, 325 authored files dated inside a 185-day window falling on 113 distinct days.

Part IX — The index of the indexes

[E] Ten enumerations of the corpus now stand in the record. They were built over five months, by different methods, from different sources, and they count five different units between them. Set side by side they are an instrument of their own: an index whose entries are indexes.

[F] The totals cannot be added. 377 files, 204 documents, 1,063 subjects, 812 entries and 116 plates are five counts of five things, and three of the five overlap in ways no listing can resolve without opening every file. What can be done, and is done below, is to state each one in its own unit, name what each one alone records, and set out the corpus-level figures the ten agree on.

27. The ten enumerations

index	date	unit co unted	count	what it covers	built from
Master Document	May	docum ents	22	the working set of the May sessions,	the May working files

Index	2026			in six categories	
Master Corpus Index	18 Jun 2026	documents	204	20 April – 18 June 2026, 59 days	the author’s working files for the period
Overview Papers	19 Jul	documents	21	the overview and architecture layer,	25 photographs across
Index and Running	2026			in prescribed reading order	three batches
Order					
Sulfur Archive Plate	13 Aug	plates	116	the physical collage archive, 275	the photographed plates
Index	2026			MB	
816 Subject Matter	16 Aug	subjects	188	Volume 816, 185 pages — 144	twenty photographs of
Index	2026			carried, 44 ARCHIVE	the Extreme SSD
816 Master Subject	16 Aug	subjects	1,063	the corpus of 6,600 files and 20.37	six batches of
Matter Index	2026			GB — 160 carried, 903 ARCHIVE	photographs: the file tree and the conversation archive
Index to the	16 Sep	index	812	PP-2026-MASTER-01 v329, to	the built volume,
full-length volume,	2026	entries		section and page	searched
v329					

[INV p.75]

index	date	unit counted	count	what it covers	built from
Sulfur Cliff’s Notes	14 Oct	chapters	34	two mind maps, about 186	the mind maps
outline	2026			numbered claims between them	
Cliff’s Notes	15 Oct	chapters	60 and	the 2,572-page volume and the	the built volume and the
Curriculum	2026	and protocols	21	56-page sulfur paper	companion paper
Corpus Inventory	16 Oct 2026	files	377	one desktop folder of thirteen — 328 authored, 49 reference	fifteen photographs of a Finder window

28. The same ten, indexed by the unit they count

The index of the indexes proper: each unit of enumeration, the indexes that count it, and what counting at that level is the only way to see.

unit	indexes that count it	what that level alone records
file	Corpus Inventory (377)	the only enumeration at file level; counts versions and duplicates as separate items because a listing cannot open them
document	Master Document Index (22) · Master Corpus Index (204) · Overview Index (21)	three counts of the same unit over three different windows and at three different levels of selection — a session set, a period set, and a curated layer
subject	816 Subject Matter Index (188) · 816 Master Subject Matter Index (1,063)	the second is a superset of the first; together they are the only enumeration of what the corpus is about rather than what it consists of
index entry	Index to v329 (812)	the only enumeration that resolves a term to a section as well as a page, and the only one built by searching the finished object rather than by hand
plate	Sulfur Archive Plate Index (116)	the only enumeration of physical objects, and the only one in which adjacency carries meaning
chapter	Cliff's Notes Curriculum (60) · Sulfur outline (34) · Atomic Molecular Book (9) · memoir (14)	the level at which the corpus states what it argues; 117 chapters in all across the four
numbered	Unification of Central Dogma Theory (30)	the finest-grained unit the record carries, and the one the
section	· the volume, as the curriculum states it (1,753) · the sulfur paper (52)	v329 index resolves to
protocol	Cliff's Notes Curriculum (21)	the only enumeration of unperformed work, each entry costed; eleven of the twenty-one need no bench
year	Dancing to My Own Tune (14 chapters, 1950–2026)	the only enumeration whose unit is a period of a life

[F] Four of the nine units are counted by one index only. If any one of those four documents were lost, the corpus would lose the only record it has at that level: the physical plates, [INV p.76] the entry-to-section resolution of the volume, the costed protocols, and the file-level listing of the working folder. That is an argument for keeping each of the ten in the record as a document in its own right, which is what Part VI does.

29. The corpus-level figures, and which index states each one

figure	as stated	stated in
files in the corpus	6,600	816 Master Subject Matter Index
bytes in the corpus	20.37 GB	816 Master Subject Matter Index

papers written, documented and read	more than 1,500	the author's own count
files in the "triple helix" folder	377	Corpus Inventory v1
desktop folders of which it is one	13	Corpus Inventory v1
documents in the 59-day window	204	Master Corpus Index
pages in the evidence volume	2,572	Cliff's Notes Curriculum
Parts in the evidence volume	169	Cliff's Notes Curriculum
numbered sections in the evidence volume	1,753	Cliff's Notes Curriculum
pages in Volume 816	185	both 816 indexes
index entries in v329	812	index to v329
plates in the sulfur archive	116, at 275 MB	Plate Index
numbered functions of sulfur	34	Plate Index, Plate 072
color-coded figures held	roughly 10,000	Corpus Inventory v1
named subjects, corpus-wide	1,063	816 Master Subject Matter Index
of those, written into the volume	160	816 Master Subject Matter Index
of those, still outside it	903	816 Master Subject Matter Index

[F] Two figures in that table carry the weight. 6,600 files and 20.37 GB is the widest statement of the corpus's extent anywhere in the record, and it comes from an index built by photographing a file tree rather than by estimating. 903 subjects standing outside the volume is the widest statement of what is still to be written, and it comes from the same index. The corpus and its frontier are measured by one instrument, in one unit, on one day — 16 August 2026.

30. Indexes named in the record but not yet entered

Each of these is named by one of the thirteen documents or appears in the folder listing of Part III. None is reproduced here, and each would extend this Part when it arrives.

13.6 The register of concepts, terms and phrases [INV Part X]

[INV p.77]

index	as named
The claims register	PP-2026-REGISTER-01 v1, 9 September 2026
The claim census	dated 9 September 2026
The corpus map	PP-2026-169-01, 16 September 2026
The fact-check registry, batch 3	named in the overview running order, July 2026
Appendix B to the evidence volume	the register of 816 subjects in three tiers — evidenced, carried, open
The chapter assignment map	sorts corpus files into the twenty-one chapters and proposes five more

The master domain scaffold	the corpus by four domains
The corpus organizer	the corpus by seven cosmic epochs and five threads
The position paper registry	dated 1 June 2026 in the folder listing
The corpus full listing	dated 20 June 2026 in the folder listing
The wall inventory	dated 14 August 2026 in the folder listing
The 816 seven-questions outline	PP-2026-OUTLINE-816, 16 August 2026
The mind-map sorts	the word-level sort and the sort into the master outline, July 2026
The extended fact-check deep report	dated 17 July 2026 in the folder listing

[O] Fourteen further indexes are named in the record and not yet in it. The pattern they make is itself a finding about method: this corpus indexes itself habitually, in several units at once, and has done so since May 2026. Whether the habit preceded the volume or was forced by it is not settled by any of the documents here.

Part X — The register of concepts, terms and phrases

[E] The thirteen documents introduce a vocabulary of their own: named instruments, named readings, named figures, and a small number of coinages. All of it is registered below, alphabetically, with the document each term comes from. 161 terms are registered.

[F] The register is evidence of a kind a file listing cannot give. A body of work that names its instruments the same way twice, across documents produced months apart and in different forms — a spreadsheet, a plate survey, a memoir, a curriculum — is one body of work rather than a series of enthusiasms. The station, the pull-off, the gatekeeper, the ARCHIVE marker, the office of a letter, the frame-zero: each is used in the same sense wherever it appears.

The sources, as cited in the register

term or phrase	what it names	source
element availability	The plate pair reading volt-equivalent against oxidation state at pH 7, in which sulfur spans the full width and no other biological element does.	PLATE
an export, not a sitting	The reading of a single-day cluster in which many files were written to disk in one or two minutes.	INV
the Extreme SSD	The drive whose file tree was photographed to build the subject indexes.	816, 816F
a fact about what was in	That the canonical table records which bases could be purified in the	AMB
the flask	1950s and 1960s rather than what nature uses.	
the fan, organelle-sorted	Twenty-seven outward arrows from one kinase, filed by the organelle in which each target acts, with the zeros read as informative as the counts.	CURR
the fault logic controller	The process document: a sixty-three-step launch sequence and a three-law fault protocol held to six sigma.	OVR
fidelity-sharpener	The office of the sulfur pyrimidine: the letter that narrows error.	AMB
finance as the silent	The capstone’s addition of a seventh discipline to the six.	OVR
seventh		
the five-category	The epistemic scheme by which claims are sorted before they are	OVR
standard	argued.	
the floor, not the total	The standing of any count drawn from one photographed folder of thirteen.	INV
formally closed	The dated act of fixing a framework so that later work extends rather than revises it.	JUN, OVR
frame-zero	The position assigned to IMP in the system architecture, with XMP as terminus.	MAY
front door	The function assigned to the document a reader should meet first.	OVR
the fusion scar	The telomere chapter’s name for what remains where ends were joined. SCN	
the geometry of things	What a teacher gave him, named in the chapter title.	MEM
the grace period	The disclosure interval the volume records, beside absolute novelty.	V329

gravity as the incircle	Space as triangular and gravity as the circle inscribed equidistant from the three force vectors.	MAY
the handle	Adenosine on a cofactor, contributing nothing to the chemistry and everything to recognition.	AMB
hero plate	A plate nominated for reproduction because it carries an argument on its own.	PLATE
hub versus spoke	The question nine Phase 3 programs are read against: whether to inhibit the node or its outputs.	SCN, CURR

[INV p.82]

term or phrase	what it names	source
human genome super	The legend of Plates 019 and 025, over the respiratory chain.	PLATE
string		
the hydrated electron	The prebiotic reductant indexed beside sulfite.	V329
the ionization-energy	The ordered cost of removing an electron, from 8-oxoguanine at 7.11	SCN
ladder	eV to orotate at 8.94 eV, with the gatekeepers resisting oxidation more than the products.	
IXGAUOCT	The eight nucleotides of actual metabolism, set against the five letters of the genetic record.	V329
k = ij	The quaternion statement of the third strand: that it is the product of the first two.	MAY
the key governs	The rule for the archive: where a plate and the color key disagree, the key governs, and pink on older plates reads as red.	PLATE
kinetic gears	The reading of start IA and the stops OO, II and TT as rate controls rather than as punctuation.	SCN
a life carries no row	The color key's own note when the subject is not one of the keyed elements — the convention operating as intended rather than an omission.	MEM, CURR
live links	That the primary section, the secondary sections and the pages are all navigable rather than printed references.	V329
the load-bearing walls	The sections the author has already marked as the ones the argument rests on, which is what makes the later Parts quick to read.	CURR
map:nodes	The column tying every proposed chapter to the numbered claims of the mind map it draws on, so that nothing in either map is orphaned.	SCN
the missing genetic code	The legend of Plate 112, a full node-and-edge network running from start to extinction.	PLATE
nine to two	Nitrogenase's nine sulfurs against the two-sulfur dithiolene of every post-oxygen molybdenum enzyme: one number changing across one boundary in one element.	CURR

the nitrogen bank has	The reason the seed carries four purines.	AM B
four departments		
the non-degenerate code	Twenty-two amino acids on twenty-two unique codons, degeneracy disappearing when the alphabet is eight rather than four.	SCN
nucleotide genomic	The subject under which the notation argument is filed.	816
language		
nucleotide policing	The repair and sanitizing systems read as a police function over the nucleotide pool.	SCN
null hypotheses	The closing chapter in which the corpus states what would have to be true for it to be wrong.	CURR

[INV p.83]

term or phrase	what it names	source
the number to remember	The one figure that anchors a chapter — nine oxidation states, twenty-seven arrows, nine sulfurs to two.	SCN
the octahedron model	Six bases at the six vertices of a regular octahedron, its twelve edges the twelve pairing relationships.	CDU
the official axis mapping	The three-row table marked never to be modified: X is DNA and the past, Y is RNA and the present, Z is ANA and the future.	MAY
the official sixes	The named set in the closure document, beside the silent sevenths and the seven prime questions.	MAY
one idea per sitting	The form the outline argues for: short chapters, because the material is a chain and a chain is best read link by link.	SCN
one valve, operated by a	The seed’s single gated position.	AM B
proton		
an open question at	The proton-tunneling question the paper raises and marks as open.	CDU
thymine’s methyl group		
orient, map, build, police,	The running order the overview index prescribes for reading the	OVR
flagship, synthesis,	corpus.	
frontier, deep dives		
origin language:	The subject tying the English language work to the code work.	816
alphabet, numbers and		
sounds		
the original shipment	That hypoxanthine arrived in the same rock, at the same time, in the same abundance as adenine and guanine — and was not a later modification of adenine.	AMB

the overview layer	The architecture stratum of the corpus: the maps, the keys and the scaffolds rather than the papers.	OVR
parent, child one, child	Plate 015’s reading of the purines: inosine the parent, adenosine and	PLATE
two	guanosine the children, and the question of what omitting the parent would cause.	
particles of speech	The grammatical subject carried into the volume beside the wobble material.	816
pH-gated selector, not a	The office of xanthine in the seed table: a valve rather than a character.	AM B
letter		
the pi-dimension rotation	The mechanism the physics papers name for an expansion that never closes.	MAY
plate	A physical collage construction, torn and layered by hand and photographed against a dark ground.	PLATE
primary and alternate	The pair of titles each proposed chapter carries, either of which the	SCN
title	author may take.	

[INV p.84]

term or phrase	what it names	source
primary section	The section whose title carries the term, where such a section exists, and otherwise the earliest section in which it appears.	V329
priority of disclosure	The record of first public placement of the central claims — March 2015, and continuously in public writing since.	AM B
probiotic, postbiotic,	The bacterial triad mapped onto the three axes — living agent, encoded	MAY
parabiotic	output, enabling interface.	
product of nature	The doctrine the volume indexes beside the human genome material.	V32 9
protocol index	The consolidated list of twenty-one experiments the chapters generate, numbered unbroken.	CURR
pull-off	A historical marker worth leaving the road for — the dated artifact or paper that explains why a field settled where it did.	CURR
the purine oxidation	IMP to XMP to GMP, hypoxanthine to xanthine to urate, with the	SCN
ladder and its defenses	enzymes that police each step.	
the rabbit hole	The chapter and the period: 2000 onward, the descent into the problem. MEM	
a reading period, not a	The reading of the longest break in authoring, during which reference	INV
stop	papers were downloaded into the folder.

series solution	corpus.	
the release valve	What the collaboration of 2026 is called in the preface.	MEM
resolved rather than	That the page references were found by searching the built volume	816F
assigned	rather than attached by hand.	
resurrection	The chapter covering April 2025, the surgery, and the decision taken on waking.	MEM
root monomer	The office assigned to IMP in the seed table — the nucleotide everything branches from.	AMB
the rule set behind gene	The fifth Part’s subject: coding and decoding as one rule set with two	CDU
and epigenetic editing	levers.	
the scientific arc of man’s	The volume’s own title for the span it covers, from the Big Bang to the	V329
evolution	human genome.	
the sealed answer sheet	The format in which a prediction is fixed before the answer is available, proposed for a claim it was not shaped around.	CURR
secondary sections	Every other section that mentions the term, in order, capped at twelve with the remainder counted.	V329
the sequence has no	That complementarity does not vary with conformation, and	CURR,
shape	conformation is what decides whether a molecule can be reached.	AMB
serpentinization	The mineral process indexed beside the alkaline hydrothermal field.	V329

[INV p.85]

term or phrase	what it names	source
seven colors, the eighth	The book’s own subtitle and its structure: a chapter for each color, an	AMB
chapter, and the	eighth for what the seven disclose together, a ninth for what they were	
seven-letter seed	at the beginning.	
seven cosmic epochs	The timeline across 13.8 billion years, with five interweaving threads.	OVR
the seven operations	Electron carriage, disulfide, metal binding, thioester, sulfonium, recognition, and antioxidant defense — the jobs the outline says cover everything sulfur does.	SCN
the seven prime	The seven questions the framework is organized around, later giving	MAY, OVR
questions	the seven agents their names.	

the seven-agent hive	The framework in which seven agents are named for the seven questions, with Which as leader.	OVR
the seven-letter seed	The proposed initial genetic code written in nucleotides rather than letters, four purines and three pyrimidines.	AMB
the silent seventh	The named subject for what the six do not account for.	816, OVR
the silent sevenths	The second named set of the closure document.	MAY
the sliver and the bulk	Editing’s two functions — the fraction that recodes a protein against the transcriptome-wide marking — held as two functions of one enzyme.	CURR
the spine	Plate 072, the single torn strip carrying the 34 numbered functions of sulfur — the archive’s own table of contents, which precedes the manuscript.	PLATE
station	One of the four pieces of apparatus every Part of the curriculum carries besides its chapter table.	CURR
stella octangula	The geometric figure indexed beside the hexagon and the self-dual tetrahedron.	V329
sulfur prismatic photon	Function 17 of the spine plate — the physics item sitting inside the	PLATE
color parser	biological run.	
sulfur protein photonic	The legend of Plates 064 and 065, with atom-photon interactions.	PLATE
color helical strings		
sulfur selenium silicon	Function 34, the last of the spine plate.	PLATE
superconductor triode		
sulfur sine wavelet	Function 33 of the spine plate.	PLATE
generators		
sulfur universal chemical	Function 30 of the spine plate.	PLATE
primer		
sulfur universal genetic	Function 31 of the spine plate.	PLATE
primer		

[INV p.86]

term or phrase	what it names	source
superwobble code	A named subject standing in the corpus and outside the volume.	816
supply is not repertoire	That the availability of a monomer does not establish its use in the code.	CURR
thalamus switching	Function 10 of the spine plate.	PLATE
functions		

the thioester world	The named subject for the prebiotic account that precedes the RNA world.	816
this completes the	The index’s closing line, dated 18 June 2026.	JUN
beginning		
the three arrows of the	The directional rules, stated as arrows and then tested.	CDU, 816
dogma		
three gatekeepers	The one-way gates in the alphabet metabolism builds.	SCN, CURR
three-point attachment	The named subject for why two points cannot distinguish a hand.	816, CURR
token-similarity	The rule by which duplicate subjects were removed when six batches	816F
matching at a 0.70	of photographs were merged.	
threshold		
the transversion wall	The point at which a change of base class stops being correctable by the mechanisms available.	CURR
the twenty words	The exactly twenty technical terms the volume says cannot be replaced, defined once in ordinary language in the front matter.	CURR
the twenty-seventh	A named subject of the index, carried into the volume.	816
parameter conjecture		
two separate steps	Charging a tRNA with its amino acid and forming the peptide bond held apart as two chemical events with two catalysts.	CDU
the two-lane road	The reading the curriculum is built for: the route that stops at the markers rather than the fastest line from one point to another.	CURR
the unfinished atom	The alternate title for the chapter on why the sulfur arm kills.	SCN
upload this first	The index’s own instruction line: an index written to be read at the start of a working session rather than at the end of one.	MAY
V, S and U	The citation sigla: the evidence volume, the sulfur command paper, and the central-dogma paper.	CURR
Volume 816	The 185-page volume the two subject indexes are indexes to.	816, 816F
wall mural storyboard	The named subject for the photographed wall and the sheets it became.	816
what the notation loses	The five losses named once and recurring in every later Part: modification, rotation, absence, orientation, and the base triple.	CURR

Status (merged edition). PP-2026-VTI-01 merged desktop edition, 23 October 2026. Combines PP-2026-VOL-01 v1, PP-2026-THEMES-01 v1 and PP-2026-INVENTORY-01 v2 without changing their text; Plate N-1 is new [H] material. Nothing here is a treatment recommendation. Licensed under CC BY-NC-ND 4.0.

Unified Index

This index unites the Index of Book I (812 entries) and the consolidated subject-term index of Book II (1,157 terms) in one alphabetical sequence of 1,794 headings; 171 terms stand in both books and are entered once, with each book's entry beneath. Every field of both source indexes is carried word for word. A Book I line gives the primary section, the secondary sections and the pages of Book I; its page numbers are pages I-n. Book II lines give the source, the definition, the pages of Book II where the term occurs, and the cluster; those page numbers are pages II-n, and pages II-834 to II-860 now stand in the Combined Register, to which their links lead. Every section number, page number, cluster term and shaded term in either book is a live link, and every Index button and return arrow in Book I leads here.

From Book I

I N D E X

Index

812 entries. Every entry carries a primary section, its secondary sections, and its pages, and all three are live links. Every shaded term in the text links to its entry here, and every numbered section carries a return arrow back to this Index.

The primary section is the one whose title carries the term, where such a section exists, and otherwise the earliest section in which the term appears. Secondary sections are every other section that mentions it, in order, capped at twelve with the remainder counted. Page references are to the printed edition.

From Book II

13.8 Consolidated subject-term index (linked)

This index consolidates the 1,157 subject terms of the volume's Subject Index and the inventory's Register of concepts, terms and phrases, with theme codes from the thematic concordance where an item of the same name appears there. Every mention of a term in the book is a link to its entry here. In each entry, "Occurs on" lists every page carrying the term (each page number jumps to the first mention on that page), and "Cluster" lists the terms most often found in the same paragraph or table row, each linking to its own entry. Colored fields follow the sources' Colorkey. Built for the merged edition; the source definitions are reproduced verbatim.

Book I *primary* §16 · *secondary sections* §17, §18, §41, §119, §133, §138, §442, §465, §585, §591, §595, 670, and 15 more · *pages* 115, 117, 121, 182, 317, 334, 355-356, 363, 652, 672, 785, 791, 795, 882, 892, 940, 1010, 1073, 1264-1265, 1268, 1270, 1354, 1459-1460, 1566, 1638, 1645

adenylosuccinate lyase
Book II Source: VOL subject index
Occurs on (5 mentions, 4 pages): 103, 578, 600, 885
Cluster: nucleotide · adenine · adenosine monophosphate · adenylosuccinate synthetase · guanine · adenylate energy charge · aspartate · currency · fumarate · inosine · disease · IMP dehydrogenase

adenylosuccinate synthetase
Book II Source: VOL subject index
Occurs on (5 mentions, 5 pages): 103, 106, 108, 523, 885
Cluster: adenine · adenosine monophosphate · adenylosuccinate lyase · guanine · nucleotide · adenosine · inosine monophosphate · aspartate · currency · fumarate · inosine · branch point

adjacency and overlap as notation
Book II Source: INV register of terms; THEMES concordance · themes: T3 T10
That what is laid against what in a plate is the author’s own notation for an edge in a network. [PLATE]
Occurs on (1 mentions, 1 pages): 703

ADP
Book II Source: VOL subject index
Occurs on (9 mentions, 7 pages): 124, 128, 130, 292, 523, 559, 885
Cluster: ATP · AMP · adenine · adenylate energy charge · hydrogen · stop codon · UGA · nucleotide · PHH · PHN · PNH · UAA

adverse drug reaction
Book I *primary* §360 · *secondary sections* — · *pages* 586

aerobic respiration
Book II Source: VOL subject index
Occurs on (4 mentions, 4 pages): 49, 374, 379, 885
Cluster: oxygen · banded iron formation · cyanobacteria · iron · acceptor · atomic number · DNA · hypoxanthine · inosine · RNA · atmosphere · transition

AGA
Book II Source: VOL subject index
Occurs on (4 mentions, 4 pages): 115, 119, 391, 885
Cluster: AGG · CGA · arginine · codon · isoleucine · methionine · nucleus · organelle · release factor · stop codon · transfer RNA · transition

age as risk factor
Book II Source: VOL subject index
Occurs on (2 mentions, 2 pages): 225, 885

Cluster: cancer · power · adenine base editor · adenine editor · adenosine · adenosine monophosphate · adenylate energy charge · adenylosuccinate lyase · adenylosuccinate synthetase · ADP · aerobic respiration · AGA

AGG

Book II Source: VOL subject index
Occurs on (4 mentions, 4 pages): 115, 119, 391, 885
Cluster: AGA · CGA · arginine · codon · isoleucine · methionine · nucleus · organelle · release factor · stop codon · transfer RNA · transition

aging

Book II Source: VOL subject index
Occurs on (13 mentions, 12 pages): 97, 264, 265, 269, 558, 581, 729, 741, 834, 847, 853, 885
Cluster: telomere · gain · ARCHIVE · disease · lifespan · oxygen · selenium · sulfur · amino acid · analysis · nucleotide · RNA

agmatidine

Book I *primary* §705 · *secondary sections* §712, §713 · *pages* 921, 930-931
Book II Source: INV register of terms; THEMES concordance · themes: T3
A modified base indexed in the volume — one of the modifications the four-letter record cannot carry. [V329]
Occurs on (5 mentions, 4 pages): 463, 703, 863, 874
Cluster: record · addition not substitution · alphabet · ambiguity-widener · anticodon · concession · corpus · geometry · index entry · inosine · network · notation

Agris

Book I *primary* §428 · *secondary sections* — · *pages* 642

Akt

Book II Source: VOL subject index
Occurs on (85 mentions, 35 pages): 15, 30, 78, 277, 294, 297, 298, 319, 320, 322, 323, 324, 325, 330, 339, 348, 349, 350, 351, 352, 353, 354, 355, 360, 361, 363, 364, 365, 393, 394, 459, 493, 495, 499, 885

aspartate transcarbamoylase
Book I *primary* §443 · *secondary sections* — · *pages* 653
Book II Source: VOL subject index
Occurs on (2 mentions, 2 pages): 103, 886
Cluster: aspartate · carbamoyl phosphate synthetase · dihydroorotate dehydrogenase · glutamine · orotate · pyrimidine synthesis · aneuploidy · Anfinsen · ANK1 · anoxic · antibody · antibody-drug conjugate

ASPM
Book II Source: VOL subject index
Occurs on (7 mentions, 6 pages): 276, 318, 322, 554, 591, 886
Cluster: CEP290 · WDR62 · ATP2C1 · ATP7A · ATP7B · ABCD1 · ANK1 · ATL1 · centrosome · disease · Golgi · lysosome

assay
Book II Source: VOL subject index
Occurs on (133 mentions, 87 pages): 5, 28, 95, 99, 100, 101, 107, 111, 130, 140, 141, 142, 143, 144, 146, 147, 148, 149, 150, 151, 218, 223, 224, 225, 226, 230, 231, 232, 234, 235, 236, 237, 238, 239, 241, 242, 243, 244, 245, 246, 247, 248, 250, 254, 257, 259, 262, 263, 265, 267, 268, 269, 270, 280, 281, 293, 297, 308, 309, 331, 353, 354, 356, 359, 367, 372, 382, 394, 403, 495, 514, 516, 520, 528, 536, 544, 545, 548, 564, 573, 588, 589, 601, 605, 606, 615, 886
Cluster: DNA · prediction · instrument · cofactor · mass spectrometry · record · occupancy · validation package · thiolation · off-target · sequencing · pathway

assimilatory
Book I *primary* §48 · *secondary sections* §263, §1115, §1119 · *pages* 206, 475, 1231, 1234

astrocytoma
Book I *primary* §294 · *secondary sections* — · *pages* 529

ATL1
Book II Source: VOL subject index
Occurs on (6 mentions, 6 pages): 276, 317, 320, 552, 590, 886
Cluster: SERPINA1 · WFS1 · ATP2C1 · ATP7A · ATP7B · CFTR · disease · KCNQ1 · LDLR · POLG · RPS14 · RPS19

ATM
Book I *primary* §3 · *secondary sections* §7, §14, §15, §18, §21, §31, §38, §41, §48, §51, §53, 56, and 64 more · *pages* 79, 97, 103, 112-113, 123, 129, 144, 146, 164, 181, 183-184, 188, 206, 215, 218-219, 222, 236, 238, 241, 250, 254-256, 262, 296, 343, 347, 366, 417, 429-430, 433, 435, 438-439, 441, 444, 454, 458, 475-476, 478-479, 513, 518, 520, 539, 560, 581, 714, 746, 818-819, 909, 985, 1000, 1033, 1039, 1140, 1176, 1226-1230, 1251-1252, 1328-1329, 1366, 1390, 1404, 1406-1407, 1451, 1455, 1469, 1471, 1479, 1495, 1503-1504

atmosphere
Book II Source: VOL subject index
Occurs on (14 mentions, 11 pages): 3, 39, 50, 335, 343, 370, 372, 374, 541, 591, 886
Cluster: oxygen · sulfur · element · rainbow · wavelength · oxygenation · iron · mineral · fractionation · Great Oxidation · mass-independent fractionation · photochemistry

A-to-I
Book I *primary* §41 · *secondary sections* §133, §183, §200, §267, §295, §296, §297, §298, §300, §313, §316, 324, and 52 more · *pages* 76-77, 91, 182, 348, 401, 420, 481, 530-533, 535, 547, 549, 556, 574, 611, 614-615, 621, 637, 639-641, 667, 675, 683, 686-687, 692-693, 762-763, 768-769, 776, 778-779, 783, 837, 851, 855, 927, 946-947, 1012, 1143, 1147-1149, 1164, 1217-1219, 1225, 1265, 1300, 1302, 1307, 1309, 1323, 1329, 1481, 1484, 1520, 1551, 1555

atomic number
Book II Source: VOL subject index
Occurs on (10 mentions, 5 pages): 49, 50, 55, 85, 886
Cluster: element · sulfur · hydrogen · carbon · nitrogen · oxygen · phosphorus · selenium · color key · corpus · hydrogen bond · bond energy

ATP
Book I *primary* §915 · *secondary sections* §9, §16, §18, §28, §35, §36, §38, §40, §41, §46, §52, 53, and 109 more · *pages* 78, 90, 93, 106, 116, 121, 138, 158, 160, 164-165, 172, 198-199, 201, 216-218, 241, 246, 262, 282, 285-286, 290, 302, 312-313, 315, 318, 321-323, 335, 355-356, 359, 361, 370, 382, 396, 401, 453, 455, 461, 514, 516, 522, 573, 653, 663-664, 668-671, 686, 785-786, 791, 795-796, 815, 823-824, 826-828, 859-860, 871, 873, 896, 899, 918, 926, 931-932, 935, 937-938, 1015, 1023, 1046, 1076-1077, 1106, 1110, 1112-1113, 1116-1122, 1154, 1168, 1172, 1175, 1177, 1189, 1194, 1231, 1251, 1265-1266, 1269-1270, 1355, 1358, 1442-1446, 1457, 1463, 1511, 1565-1566, 1576, 1578, 1602-1605, 1636
Book II Source: VOL subject index
Occurs on (61 mentions, 38 pages): 35, 36, 103, 104, 105, 110, 124, 128, 130, 280, 289, 294, 295, 296, 297, 300, 308, 314, 331, 343, 378, 388, 396, 482, 523, 529, 548, 557, 558, 559, 584, 590, 599, 709, 826, 841, 866, 886
Cluster: adenine · nucleotide · ADP · guanine · salvage · calcium · xanthine · amino acid · AMP · hydrogen · stop codon · UGA

ATP sulfurylase
Book I *primary* §52 · *secondary sections* §238, §929, §937, §938 · *pages* 78, 216, 453, 1121, 1125-1126

ATP synthase
Book I *primary* §52 · *secondary sections* §114, §116, §117, §158, §915, §917, §1433, §1654 · *pages* 90, 93, 217, 312-313, 315, 382, 1112-1113, 1442, 1603
Book II Source: VOL subject index
Occurs on (2 mentions, 2 pages): 128, 886
Cluster: catalysis · codon · compartment · genetic code · hydrogen · proton gradient · tunneling · aneuploidy · Anfinsen · ANK1 · anoxic · antibody

ATP2C1
Book II Source: VOL subject index
Occurs on (7 mentions, 6 pages): 276, 317, 322, 553, 590, 886
Cluster: ATP7A · ATP7B · disease · ABCD1 · ASPM · ATL1 · Golgi · organelle · PEX1 · PEX6 · SLC30A8 · pump

ATP7A
Book II Source: VOL subject index
Occurs on (6 mentions, 6 pages): 276, 317, 322, 553, 590, 886
Cluster: ATP2C1 · ATP7B · ABCD1 · ASPM · ATL1 · disease · organelle · PEX1 · PEX6 · ANK1 · centrosome · CEP290

ATP7B
Book II Source: VOL subject index
Occurs on (6 mentions, 6 pages): 276, 317, 322, 553, 590, 886
Cluster: ATP2C1 · ATP7A · ABCD1 · ASPM · ATL1 · disease · organelle · PEX1 · PEX6 · ANK1 · centrosome · CEP290

ATPase
Book II Source: VOL subject index
Occurs on (6 mentions, 5 pages): 304, 306, 310, 317, 886
Cluster: helicase · DDX11 · domain · FANCJ · RTEL1 · XPD · thiolate · disease · ATL1 · ATP2C1 · ATP7A · ATP7B

ATR
Book I *primary* §18 · *secondary sections* §40, §65, §107, §140, §154, §197, §283, §285, §294, §381, §777, 805, and 16 more · *pages* 91, 123, 125, 173, 265, 305, 366, 379, 417, 518, 520, 529, 603, 994-995, 1024, 1032, 1039, 1103, 1106-1107, 1109, 1146, 1219, 1332, 1437, 1446, 1536-1537, 1542-1543, 1548, 1564, 1606

audit
Book II Source: VOL subject index
Occurs on (23 mentions, 18 pages): 49, 50, 51, 52, 440, 441, 477, 490, 499, 516, 517, 522, 543, 709, 744, 831, 833, 886
Cluster: sulfur · drift · carbon · element · hydrogen bond · coenzyme A · lipoate · thiol · notation · record · evidence class · element index

AUG
Book II Source: VOL subject index
Occurs on (12 mentions, 10 pages): 39, 113, 115, 131, 390, 392, 497, 543, 574, 886
Cluster: codon · hydrogen · nitrogen · phosphorus · methionine · GUG · start codon · bacteria · mitochondria · three domains · translation · amino acid

AUGCIX
Book II Source: INV register of terms; THEMES concordance · themes: T3 T4 T10
The inner ring of the storyboard’s own six letters, thymine removed. [OVR]
Occurs on (3 mentions, 3 pages): 463, 709, 875
Cluster: thymine · geometry · the Berger spinor · the blue set

automorphism group
Book I *primary* §196 · *secondary sections* §348, §361, §840 · *pages* 415, 577, 587, 1057

AZIN1
Book I *primary* §294 · *secondary sections* — · *pages* 529

B

B cell
Book I *primary* §23 · *secondary sections* §49, §301, §303, §1365, §1371 · *pages* 131, 208-209, 536, 538, 1400, 1404

B3GALNT2
Book I *primary* §385 · *secondary sections* — · *pages* 607

backbone geometry
Book II Source: VOL subject index
Occurs on (7 mentions, 7 pages): 5, 98, 218, 227, 431, 545, 886
Cluster: cofactor · folding problem · occupancy · disulfide register · outside · sulfur chemistry · protein folding · register · metal loading · sulfur · geometry · objection

bacteria
Book II Source: VOL subject index
Occurs on (23 mentions, 18 pages): 198, 208, 213, 338, 374, 390, 392, 487, 497, 597, 747, 793, 794, 855, 856, 863, 864, 887
Cluster: sulfur · mitochondria · eukaryote · sulfide · AUG · GUG · glutamate · glutamine · transfer RNA · oxygen · amino acid · codon

bacteriochlorophyll
Book I *primary* §233 · *secondary sections* §235, §253 · *pages* 448, 450, 465

carboxysulfitic

Book I *primary* — · *secondary sections* — · *pages* 82

Book II Source: INV register of terms; THEMES concordance · themes: T3

A coined adjective in the volume's keyword set, for the chemistry it names. [V329] Carboxysulfitic names the C-S connection: the carbon-sulfur bond that was formed in interstellar space, where carbon-sulfur molecules such as carbon monosulfide (CS) and carbonyl sulfide (OCS) are observed in molecular clouds. It is the second term in the sulfur thread opening order: the H2S connection first, then the C-S connection.

codon hexahedron model, 7-3-3-1
Book II Source: INV register of terms; THEMES concordance · themes: T3 T7 T10
A named subject standing outside the volume. [816] The codon hexahedron model covers all 64 mRNA codons, mapped to the 21 amino acids. It explains why wobble reduces the number of tRNAs needed to a minimum of 32: wobble at the third codon position lets one tRNA read several codons that differ only at that spot. At anticodon position 34 the two modifications act in opposite directions: sulfur's 2-thiouridine narrows the set of codons a tRNA reads, while inosine wobble widens the set of codons one tRNA can read.
Occurs on: no mention found in the merged text outside this index.

Occurs on (6 mentions, 6 pages): 69, 251, 254, 415, 525, 892
Cluster: element · record · substrate · telomere · RNA · Alu element · iron-sulfur cluster · mineral · mitochondrion · organelle · DNA · hydroxyl

energy charge
Book II Source: VOL subject index
Occurs on (9 mentions, 6 pages): 128, 129, 130, 525, 546, 892
Cluster: adenylate energy charge · prediction · UGA · glucose · selenium · selenocysteine · selenoprotein · element · readthrough · UAA · adenine · ADP

energy yield
Book II Source: VOL subject index
Occurs on (4 mentions, 4 pages): 62, 343, 405, 892
Cluster: economy · electron transfer · acceptor · DNA · radical · reversible oxidation · S-adenosylmethionine · cysteine · disulfide bond · iron-sulfur cluster · oxygen · thioester

engineered cell
Book II Source: VOL subject index
Occurs on (14 mentions, 10 pages): 296, 323, 337, 359, 363, 365, 555, 577, 594, 892
Cluster: biomanufacturing · engineered protein · ABE · Akt · akt balloon · nucleotide pool · selenium · sulfur chemistry · base editing · RNA medicine · cancer · epigenetic editing

engineered protein
Book II Source: VOL subject index
Occurs on (9 mentions, 8 pages): 278, 323, 337, 359, 393, 555, 592, 892
Cluster: disulfide · engineered cell · antibody · element · RNA · thiol · biomanufacturing · register · ADAT3 · Akt · apoptosis · cascade

engraftment
Book II Source: VOL subject index
Occurs on (3 mentions, 3 pages): 250, 259, 892
Cluster: off-target · amplicon sequencing · analysis · assay · release criteria · dosing interval · double-strand break · drift · drug target · dual-reporter · duplex stability · economy

enhancer
Book II Source: VOL subject index
Occurs on (5 mentions, 5 pages): 364, 365, 753, 859, 892
Cluster: epigenetic editor · exon · adenine editor · Cas9 · cytosine editor · gain · nuclease · outside · pathway · AMP · ARCHIVE · DNA

enrollment
Book II Source: VOL subject index
Occurs on (11 mentions, 11 pages): 82, 350, 352, 355, 356, 359, 402, 536, 563, 582, 892
Cluster: PTEN · tumor · cysteine · record · disulfide · assay · phosphatase · kinase · cofactor · analysis · Akt · clinical trial

enumeration
Book II Source: VOL subject index
Occurs on (33 mentions, 19 pages): 10, 11, 286, 427, 463, 472, 473, 544, 569, 596, 610, 631, 632, 763, 822, 841, 868, 870, 892
Cluster: corpus · record · inventory · plate · curriculum · sulfur · resurrection · transcription · pathway · nucleotide · outline · domain

epigenetic editing
Book II Source: VOL subject index
Occurs on (27 mentions, 22 pages): 95, 97, 220, 222, 244, 298, 340, 365, 395, 396, 397, 430, 456, 462, 469, 564, 609, 728, 740, 743, 881, 892
Cluster: RNA · nuclease · sulfur · adenine base editor · base editor · cytosine · deaminase · off-target · Akt · epigenetic editor · promoter · sulfonium pool

epigenetic editor
Book II Source: VOL subject index
Occurs on (15 mentions, 14 pages): 149, 218, 222, 223, 230, 248, 298, 365, 393, 394, 494, 495, 604, 892
Cluster: sequencing · mitochondrion · off-target · prediction · analysis · off-target methylation · disease · notation · outside · peptide drug · prime editor · record

epimutation
Book II Source: VOL subject index
Occurs on (10 mentions, 10 pages): 238, 239, 244, 248, 249, 525, 547, 580, 609, 892
Cluster: maintenance methylation · tumor · mismatch repair · promoter · spectrum · deletion · tumor suppressor · DNA · DNMT1 · DNMT3A · methyltransferase · acylation

Epstein-Barr
Book I *primary* §487 · *secondary sections* — · *pages* 689

equilibrium
Book II Source: VOL subject index
Occurs on (4 mentions, 4 pages): 141, 254, 286, 892
Cluster: ribose · sulfur · uridine · chromosome end · occupancy · dehydrogenase · disulfide bond · hydrogen peroxide · NAD · oxidase · oxygen · xanthine oxidoreductase

ERK
Book II Source: VOL subject index
Occurs on (2 mentions, 2 pages): 362, 892
Cluster: apoptosis · BCL-2 · BRAF · S phase · spoke · V600E · epimutation · equilibrium · eukaryote · evidence class

Eroom
Book I *primary* §284 · *secondary sections* — · *pages* 519

ERP010840
Book I *primary* §467 · *secondary sections* — · *pages* 674

erythrocyte
Book I *primary* §48 · *secondary sections* §133, §278, §281, §454, §465, §667, §1601 · *pages* 205, 343, 514, 517, 663, 672, 878-879, 1568

essential gene
Book I *primary* §1275 · *secondary sections* §1277, §1280 · *pages* 1342-1343, 1345

eukaryote
Book II Source: VOL subject index
Occurs on (10 mentions, 10 pages): 134, 138, 159, 184, 198, 208, 312, 313, 597, 892
Cluster: sulfur · bacteria · transfer RNA · biogenesis · adenine · adenosine · deamination · donor · hypoxanthine · inosine · nucleoside · position 34

evaporite
Book I *primary* §228 · *secondary sections* §1113, §1118, §1119 · *pages* 445, 1230, 1233-1235

evidence class
Book II Source: VOL subject index
Occurs on (7 mentions, 6 pages): 335, 404, 516, 520, 611, 892
Cluster: falsifier · collision · audit · open question · epimutation · equilibrium · ERK · eukaryote

evidence tag
Book II Source: VOL subject index
Occurs on (5 mentions, 5 pages): 525, 561, 574, 610, 893
Cluster: open question · excitotoxin · exocytosis · exon · expression level · extracellular flux analysis · extraction · falsification · falsifier · FANCJ · Fanconi anemia · fatty acid oxidation

excitotoxin
Book II Source: VOL subject index
Occurs on (5 mentions, 5 pages): 106, 371, 384, 403, 893
Cluster: sulfite · xanthine · sulfur · the unfinished atom · purine arm · sulfite oxidase · cofactor · nucleotide · evidence tag · exocytosis · exon · expression level

exocytosis
Book II Source: VOL subject index
Occurs on (3 mentions, 3 pages): 557, 591, 893
Cluster: calcium · insulin · release · transporter · evidence tag · excitotoxin · exon · expression level · extracellular flux analysis · extraction · falsification · falsifier

exon
Book II Source: VOL subject index
Occurs on (3 mentions, 3 pages): 241, 364, 893
Cluster: acceptor · adenosine · guanosine · inosine · off-target · ribosome · sequencing · enhancer · evidence tag · excitotoxin · exocytosis · expression level

expression level
Book II Source: VOL subject index
Occurs on (5 mentions, 5 pages): 238, 242, 243, 258, 893
Cluster: falsification · fold · DNA · inosine-specific chemistry · objection · RNA · RNA editing · ABEmax · ADAR · editome

· motif · prediction

extracellular flux analysis
Book II Source: VOL subject index
Occurs on (4 mentions, 4 pages): 300, 541, 589, 893
Cluster: acidification · glycolysis · oxygen · respiration · proton leak · intermediate · isotope tracing · evidence tag · excitotoxin · exocytosis · exon · expression level

extraction
Book II Source: VOL subject index
Occurs on (7 mentions, 7 pages): 35, 99, 514, 522, 542, 548, 893
Cluster: quenching · liquid chromatography · tandem mass spectrometry · concentration · internal standard · nucleotide · nucleotide pool · assay · ribonucleotide · monophosphate · plate · evidence tag

F

face axis
Book I *primary* §201 · *secondary sections* — · *pages* 421

false discovery rate
Book I *primary* §301 · *secondary sections* §311, §380, §387 · *pages* 536, 545, 602, 609

false positive rate
Book I *primary* §391 · *secondary sections* — · *pages* 612

falsification
Book II Source: VOL subject index
Occurs on (8 mentions, 8 pages): 217, 238, 242, 475, 490, 495, 496, 893
Cluster: objection · curriculum · expression level · instrument · DNA · inosine-specific chemistry · RNA · RNA editing · clinical trial · record · sample size · shape

falsifier
Book II Source: VOL subject index
Occurs on (41 mentions, 27 pages): 6, 7, 8, 30, 81, 131, 153, 370, 399, 401, 404, 520, 525, 564, 566, 569, 611, 614, 615, 617, 620, 622, 623, 626, 628, 630, 893
Cluster: collision · arc · theme · record · corpus · curriculum · register · concordance · element · analysis · compartment · twelve stages

FANCA
Book I *primary* §304 · *secondary sections* — · *pages* 539

FANCJ
Book II Source: VOL subject index
Occurs on (9 mentions, 8 pages): 258, 259, 304, 306, 308, 536, 579, 893
Cluster: DDX11 · RTEL1 · XPD · helicase · domain · disease · nucleotide excision repair · telomere · ATPase · G-quadruplex · Fanconi anemia · DNA

Fanconi anemia
Book II Source: VOL subject index
Occurs on (2 mentions, 2 pages): 304, 893
Cluster: FANCJ · cancer · DDX11 · disease · RTEL1 · spectrum · telomere · trichothiodystrophy · xeroderma pigmentosum · XPD · evidence tag · excitotoxin

fatty acid oxidation
Book II Source: VOL subject index
Occurs on (2 mentions, 2 pages): 556, 893
Cluster: compartment · hydrogen peroxide · mitochondrion · peroxisome · evidence tag · excitotoxin · exocytosis · exon · expression level · extracellular flux analysis · extraction · falsification

fatty-acid chain
Book II Source: VOL subject index
Occurs on (7 mentions, 6 pages): 220, 237, 246, 248, 249, 893
Cluster: peptide · incretin · acylation · half-life extension · lysine · albumin binding · amidation · peptide drug · resistance · manufacturing · side chain · half-life

FDA
Book II Source: VOL subject index
Occurs on (13 mentions, 6 pages): 324, 325, 329, 330, 488, 893
Cluster: cancer · gain · FOXO · endpoint · PTEN · Akt · ARCC · BOREAS · GLUT4 · IPATential150 · node · PREVAIL

Fe4S4
Book I *primary* §133 · *secondary sections* §228, §233, §238 · *pages* 350, 359, 444, 448, 453

feedback
Book II Source: VOL subject index
Occurs on (9 mentions, 9 pages): 267, 522, 706, 735, 769, 825, 844, 850, 893
Cluster: gain · ARCHIVE · DNA · genetic code · nucleotide · cluster assembly · mitochondrial biogenesis · p53 · RTEL1 · architecture · codon · cyanobacteria

FeMoco
Book II Source: VOL subject index
Occurs on (4 mentions, 3 pages): 3, 373, 893
Cluster: carbon · cytosine · interstitial carbon · sulfur · Archean · great oxidation event · iron · molybdenum · molybdopterin · nitrogenase · sulfur atom · triple bond

fermentation
Book II Source: VOL subject index
Occurs on (3 mentions, 3 pages): 343, 396, 893
Cluster: free energy · energy yield · glucose · release · substrate · terminal acceptor · cancer · respiration · sequencing · evidence tag · excitotoxin · exocytosis

ferredoxin
Book I *primary* §237 · *secondary sections* §40, §52, §133, §159, §228, §230, §233, §234, §236, §238, §242, 243, and 2 more · *pages* 171, 216, 359, 383, 444, 446, 448-449, 451-453, 456-457, 898, 902
Book II Source: VOL subject index
Occurs on (19 mentions, 17 pages): 80, 234, 335, 337, 343, 344, 385, 392, 431, 478, 484, 742, 753, 769, 836, 853, 893
Cluster: mineral · greigite · cubane · iron · mackinawite · cysteine · geometry · sulfur · sulfide · respiratory chain · thiolate · hydrogen sulfide

ferroelectric
Book I *primary* §160 · *secondary sections* §216, §227, §266 · *pages* 384, 434, 443, 477

ferroptosis
Book I *primary* §283 · *secondary sections* §55, §150, §151, §153, §154, §156, §157, §266, §284, §287, §288, 387, and 2 more · *pages* 230-232, 375-376, 378-381, 477, 518-519, 522-523, 608, 1325, 1415

fidelity-sharpener
Book II Source: INV register of terms; THEMES concordance · themes: T1 T3 T8
The office of the sulfur pyrimidine: the letter that narrows error. [AMB]
Occurs on (4 mentions, 4 pages): 452, 465, 742, 877
Cluster: pyrimidine · sulfur · deoxy gateway

finance as the silent seventh
Book II Source: INV register of terms; THEMES concordance
The capstone’s addition of a seventh discipline to the six. [OVR]
Occurs on (1 mentions, 1 pages): 743

FIS1

Gabra-3

Book I *primary* §316 · *secondary sections* §324, §326 · *pages* 549, 556, 558

gain

Book II Source: VOL subject index
Occurs on (15 mentions, 14 pages): 65, 265, 267, 269, 325, 360, 365, 409, 446, 518, 522, 564, 581, 893
Cluster: aging · feedback · FDA · oxygen · ribonucleotide reductase · S10 · S11 · separate · splicing · assay · cluster occupancy · cluster assembly

gain type

Book I *primary* §338 · *secondary sections* §339, §341 · *pages* 568-569, 571

gate

Book I *primary* §443 · *secondary sections* §4, §10, §12, §13, §17, §18, §31, §33, §36, §37, §38, 39, and 145 more · *pages* 62, 65, 67, 76, 87, 91, 100, 107, 109-111, 117-125, 142, 147, 151, 159, 161, 164, 167, 175-181, 188, 192, 231, 233, 244-245, 262, 270, 297, 302, 309, 311, 313, 317, 320, 323, 325, 334-339, 341, 354-356, 359, 361, 374, 376, 378, 388, 401, 405, 408-410, 420-421, 427, 432, 453, 465, 471, 474, 478, 483, 505-507, 522, 530, 533, 635, 658-662, 665-666, 687, 691, 693, 716, 725, 766, 784, 788, 790, 793-795, 797, 830-831, 841-842, 893, 897, 957, 964, 971-972, 977, 980, 983, 1007, 1018, 1025, 1027, 1066, 1072, 1074-1075, 1105, 1119, 1123, 1126, 1136, 1147, 1163, 1168, 1178, 1186-1189, 1212-1213, 1221, 1236, 1240-1241, 1265, 1268-1270, 1292, 1401, 1405, 1431, 1445, 1447, 1449, 1486, 1495, 1503, 1505, 1539, 1542, 1567, 1578, 1597, 1600-1601, 1645, 1650, 1662-1666

gatekeeper

Book I *primary* §588 · *secondary sections* §133, §268, §584, §590, §593, §594, §595, §596, §626, §634, §680, 905, and 5 more · *pages* 341, 505, 784, 788, 790, 797, 831, 841, 893, 1105, 1542, 1567, 1597, 1600-1601
Book II Source: VOL subject index
Occurs on (37 mentions, 30 pages): 4, 7, 28, 34, 44, 46, 66, 78, 93, 95, 102, 105, 112, 337, 338, 341, 410, 463, 466, 475, 481, 525, 547, 562, 623, 738, 807, 872, 878, 893
Cluster: nucleotide · pyrimidine · pathway · purine · DNA · inosine monophosphate · inosine · record · plate · element · purpose · separate

Gattegno

Book I *primary* §257 · *secondary sections* — · *pages* 470

GBA1

Book II Source: VOL subject index
Occurs on (10 mentions, 7 pages): 276, 316, 318, 319, 552, 589, 894
Cluster: GLA · HEXA · ANK1 · disease · DMD · MYH7 · LMNA · TP53 · element · cancer · Golgi · lysosome

G-ball

Book I *primary* §192 · *secondary sections* §202, §206 · *pages* 410, 422, 425

gel electrophoresis

Book II Source: VOL subject index
Occurs on (2 mentions, 2 pages): 267, 894
Cluster: resolution · t-circle · dehydrogenase · GBA1 · gemcitabine · gene expression · genetic alphabet · genetic code · genetically encoded sensor · genomics · geometry · GGG

gemcitabine

Book II Source: VOL subject index
Occurs on (3 mentions, 3 pages): 309, 310, 894
Cluster: intermediate · substrate · hydroxyurea · dehydrogenase · GBA1 · gel electrophoresis · gene expression · genetic alphabet · genetic code · genetically encoded sensor · genomics · geometry

gene conversion

Book I *primary* §88 · *secondary sections* §311 · *pages* 288, 545

gene expression

Book II Source: VOL subject index
Occurs on (14 mentions, 7 pages): 129, 699, 745, 838, 854, 855, 894
Cluster: ARCHIVE · DNA · geometry · genetic code · protein synthesis · glutathione · glycine · stop codon · UAA · UGA · allocation · amino acid

Genentech
Book I *primary* §467 · *secondary sections* — · *pages* 674

genetic alphabet
Book II Source: VOL subject index
Occurs on (6 mentions, 6 pages): 3, 105, 108, 800, 858, 894
Cluster: nucleotide · allopurinol · gout · DNA · genetic code · geometry · instrument · record · concentration · hypoxanthine · purine · xanthine

genetic code
Book II Source: VOL subject index
Occurs on (170 mentions, 105 pages): 16, 27, 45, 46, 53, 56, 57, 63, 86, 87, 102, 107, 125, 128, 129, 134, 146, 155, 156, 204, 207, 211, 245, 249, 256, 275, 314, 339, 384, 386, 387, 406, 425, 431, 452, 469, 474, 502, 504, 512, 513, 524, 525, 549, 562, 590, 608, 699, 700, 705, 710, 717, 719, 726, 734, 745, 746, 749, 752, 755, 757, 759, 770, 772, 776, 782, 783, 785, 788, 790, 795, 796, 798, 800, 802, 805, 828, 830, 832, 834, 836, 837, 838, 839, 841, 842, 844, 845, 846, 848, 849, 850, 851, 852, 853, 854, 855, 856, 857, 858, 859, 860, 861, 882, 894
Cluster: ARCHIVE · nucleotide · RNA · DNA · amino acid · codon · inosine · sulfur · wobble · purine · architecture · element

genetically encoded sensor
Book II Source: VOL subject index
Occurs on (5 mentions, 5 pages): 36, 289, 514, 575, 894
Cluster: glutathione · concentration · peroxide · ATP · calcium · electron microscopy · imaging · membrane contact site · network · organelle · proximity labeling · twelve conversations

genome recoding
Book I *primary* §450 · *secondary sections* — · *pages* 659

genomics
Book II Source: VOL subject index
Occurs on (6 mentions, 6 pages): 225, 563, 608, 792, 855, 894
Cluster: ARCHIVE · regulatory review · validation package · bacteria · DNA · element · hypothesis · knockout · oxidation state · RNA · sulfate · sulfide

geometry
Book II Source: VOL subject index
Occurs on (100 mentions, 77 pages): 5, 27, 33, 53, 58, 67, 73, 84, 88, 94, 95, 96, 97, 98, 169, 207, 229, 259, 260, 334, 335, 341, 343, 344, 345, 362, 365, 385, 411, 419, 432, 449, 463, 474, 484, 487, 489, 490, 501, 505, 511, 512, 525, 565, 569, 570, 572, 581, 596, 611, 699, 702, 708, 726, 736, 746, 751, 764, 781, 791, 802, 803, 804, 807, 824, 832, 838, 842, 848, 851, 854, 855, 858, 860, 861, 875, 894
Cluster: nucleotide · DNA · mineral · cubane · ARCHIVE · record · architecture · phosphate · corpus · genetic code · sulfur · notation

gestational diabetes
Book I *primary* §281 · *secondary sections* §286, §287 · *pages* 517, 521-522

GGG
Book II Source: VOL subject index
Occurs on (2 mentions, 2 pages): 115, 894
Cluster: dehydrogenase · GBA1 · gel electrophoresis · gemcitabine · gene expression · genetic alphabet · genetic code · genetically encoded sensor · genomics · geometry · GLA · GLP

GLA
Book II Source: VOL subject index
Occurs on (10 mentions, 7 pages): 276, 316, 318, 319, 552, 589, 894
Cluster: GBA1 · HEXA · ANK1 · disease · DMD · MYH7 · LMNA · TP53 · element · cancer · Golgi · lysosome

GLI1
Book I *primary* §294 · *secondary sections* §318, §320, §325, §326 · *pages* 529, 551, 553, 557-558

glioblastoma
Book I *primary* §38 · *secondary sections* §294 · *pages* 165, 529

glioma
Book I *primary* §294 · *secondary sections* §318, §1450, §1582 · *pages* 529, 551, 1453, 1553

GLP
Book II Source: VOL subject index
Occurs on (1 mentions, 1 pages): 894
Cluster: dehydrogenase · GBA1 · gel electrophoresis · gemcitabine · gene expression · genetic alphabet · genetic code · genetically encoded sensor · genomics · geometry · GGG · GLA

glucose
Book I *primary* §247 · *secondary sections* §7, §56, §104, §114, §122, §133, §185, §235, §244, §249, §250, 278, and 9 more · *pages* 91, 104, 238, 303, 312, 321, 359, 403, 450, 458, 460-463, 514, 527, 1044, 1106, 1136, 1171, 1339, 1569, 1594, 1602

Book II Source: VOL subject index
Occurs on (20 mentions, 15 pages): 99, 128, 130, 294, 300, 302, 322, 343, 349, 351, 356, 585, 746, 864, 894
Cluster: arrow · GLUT4 · pathway · glutamine · substrate · Akt · sulfur · dehydrogenase · intermediate · plasma membrane · transporter · flux

glucose uptake
Book II Source: VOL subject index
Occurs on (5 mentions, 5 pages): 324, 356, 358, 363, 894
Cluster: nucleotide pool · glucose · Akt · cell cycle · notation · NovagonDNA · proliferation · record · selection pressure · sulfur chemistry · kinase · plasma membrane

GluR-B
Book I *primary* §291 · *secondary sections* §293, §294, §631, §638, §643, §648, §1404 · *pages* 526, 528-529, 837, 846, 851, 855, 1425

GLUT4
Book II Source: VOL subject index
Occurs on (11 mentions, 9 pages): 294, 322, 330, 348, 351, 361, 393, 494, 894
Cluster: FOXO · Akt · glucose · transcription factor · arrow · pathway · node · GSK3 · glycolysis · Golgi · mTORC1 · plasma membrane

glutamate
Book II Source: VOL subject index
Occurs on (17 mentions, 13 pages): 115, 119, 147, 164, 175, 208, 209, 211, 213, 339, 377, 560, 894
Cluster: glutamine · glycine · lysine · amino acid · asparagine · aspartate · codon · nucleotide · bacteria · mitochondria · transfer RNA · histidine

glutamine
Book II Source: VOL subject index
Occurs on (30 mentions, 23 pages): 99, 102, 103, 109, 115, 119, 147, 164, 173, 176, 208, 209, 211, 213, 300, 391, 548, 559, 560, 599, 601, 608, 894
Cluster: glutamate · aspartate · nucleotide · glycine · guanine · glucose · adenine · ATP · GMP synthase · amino acid · codon · transfer RNA

glutaredoxin
Book II Source: VOL subject index
Occurs on (11 mentions, 11 pages): 59, 89, 303, 305, 308, 311, 338, 340, 483, 575, 894
Cluster: thioredoxin · disulfide · cysteine · DNA · NADPH · deoxyribonucleotide · reducing equivalents · thiyl radical · hydrogen · RNA world · active-site cysteine · radical

glutathione
Book I *primary* §7 · *secondary sections* §10, §36, §42, §54, §56, §57, §81, §123, §136, §138, §150, 154, and 53 more · *pages* 78, 84, 103-104, 107, 160, 190, 225, 227, 229, 237-239, 280, 322, 362-363, 375, 379-381, 396, 404, 460, 541-542, 547, 551, 557, 608, 631, 984, 991-992, 999, 1038, 1140, 1179, 1181, 1202-1205, 1232-1235, 1295, 1318, 1325, 1348, 1351, 1354-1360, 1362, 1364, 1370, 1444-1445, 1451, 1591, 1612-1614
Book II Source: THEMES concordance; VOL subject index · themes: T1
Occurs on (76 mentions, 50 pages): 35, 36, 38, 115, 119, 142, 143, 229, 231, 272, 273, 274, 276, 279, 284, 285, 286, 288, 289, 294, 296, 311, 312, 314, 332, 333, 334, 336, 339, 350, 352, 385, 401, 514, 515, 521, 525, 549, 550, 551, 554, 575, 577, 580, 595, 597, 747, 836, 855, 894
Cluster: cysteine · concentration · sulfur · wobble · thioredoxin · methionine · thiol · peroxiredoxin · taurine · thiolation · S-adenosylmethionine · millimolar

glutathione peroxidase
Book II Source: VOL subject index
Occurs on (6 mentions, 6 pages): 39, 48, 130, 284, 577, 894
Cluster: selenium · selenocysteine · element · thiol · cysteine · thioredoxin reductase · glutathione · abundance · stop codon · sulfur · the silent seventh · register

glutathione reductase
Book I *primary* §56 · *secondary sections* §306, §313, §318, §325, §387, §414, §1247 · *pages* 238, 541, 547, 551, 557, 608, 631, 1325

glycan
Book II Source: VOL subject index
Occurs on (5 mentions, 5 pages): 547, 557, 591, 597, 894
Cluster: Golgi · glycosylation · glutathione · lipid · coenzyme · lipoate · molybdenum cofactor · nucleoside · S-adenosylmethionine · dehydrogenase · GBA1 · gel electrophoresis

glycine
Book I *primary* §92 · *secondary sections* §16, §18, §22, §31, §34, §35, §41, §45, §48, §52, §58, 65, and 55 more · *pages* 90-91, 116, 125, 130, 147, 155, 157, 181, 187-188, 197, 206, 216-217, 241, 258, 261, 277, 280, 289, 291-293, 295, 302, 322-323, 369, 389, 412, 424, 484, 529, 585, 588, 649, 845, 854-855, 869, 1009, 1169, 1179, 1356, 1358-1360, 1466, 1468, 1537, 1583-1594, 1612, 1639-1641, 1647-1650, 1653

Book II Source: THEMES concordance; VOL subject index · themes: T5
Occurs on (34 mentions, 26 pages): 99, 102, 109, 115, 119, 166, 177, 178, 209, 211, 237, 238, 240, 246, 248, 339, 386, 391, 400, 486, 548, 560, 747, 836, 855, 894
Cluster: alanine · codon · glutamine · amidation · glutathione · genetic code · aspartate · base pair · glutamate · wobble · record · peptide

glycolysis
Book I *primary* §28 · *secondary sections* §104, §114, §134, §247, §249, §1012, §1030, §1068, §1447, §1651 · *pages* 138, 303, 312, 360, 461-462, 1172, 1182, 1202, 1451, 1602
Book II Source: VOL subject index
Occurs on (35 mentions, 27 pages): 4, 5, 28, 34, 73, 74, 258, 287, 291, 292, 294, 298, 299, 300, 301, 345, 396, 419, 420, 449, 541, 564, 584, 586, 589, 797, 894
Cluster: thioester · sulfur · dehydrogenase · citric acid cycle · iron · respiration · lipoate · intermediate · cofactor · element · electron transfer · radical

glycosidic angle
Book I *primary* §432 · *secondary sections* §439, §730, §732, §739, §743 · *pages* 645, 650, 950-951, 959-960, 963

glycosylation
Book II Source: VOL subject index
Occurs on (8 mentions, 6 pages): 280, 281, 547, 557, 590, 894
Cluster: Golgi · assay · endoplasmic reticulum · glycan · lipid · membrane potential · compartment · prediction · respiration · dehydrogenase · GBA1 · gel electrophoresis

GMP
Book II Source: VOL subject index · color green
Occurs on (15 mentions, 10 pages): 105, 112, 124, 146, 379, 468, 481, 868, 880, 894
Cluster: IMP · XMP · AMP · purine · pyrimidine · UMP · CMP · xanthine · de novo purine synthesis · gatekeeper · inosine monophosphate · nucleotide

GMP synthase
Book II Source: VOL subject index · color green
Occurs on (7 mentions, 7 pages): 103, 104, 105, 106, 559, 599, 894
Cluster: guanine · IMP dehydrogenase · glutamine · xanthosine monophosphate · ATP · guanosine monophosphate · nucleotide · GMP · guanosine · adenine · currency · inosine

GMP synthetase
Book I *primary* §17 · *secondary sections* §18, §41, §133, §442, §443, §465, §482, §483, §490, §585, §588, 589, and 14 more · *pages* 117-118, 121, 178, 182, 335, 356, 652-653, 672, 686-687, 692, 785, 788-789, 795, 797, 813, 892, 1565-1567, 1569, 1578-1579, 1638, 1642, 1647, 1650

GNB1
Book I *primary* §304 · *secondary sections* — · *pages* 539

Golgi
Book II Source: VOL subject index
Occurs on (19 mentions, 16 pages): 273, 275, 276, 280, 297, 315, 321, 322, 351, 493, 547, 553, 557, 590, 591, 894

IXGAUOCT

Book II Source: INV register of terms; THEMES concordance · themes: T3 T6
The eight nucleotides of actual metabolism, set against the five letters of the genetic record. [V329] The eight letters are the mononucleotides that are never specified in the current genetic code: I, X, G, A, U, O, C and T, for IMP, XMP, GMP, AMP, UMP, OMP, CMP and TMP. The author's expanded genetic code has three sets of codes: the DNA code (A, T, G, C), the RNA code (A, U, G, C), and the inosine wobble code (I, U, I, C, A, U). The letters X and O do not match any letter of the genetic code: they stand for the nucleotides that are not specified because they sit outside the end results of the metabolic process. They are gatekeepers, but they are not end results.

Occurs on (19 mentions, 18 pages): 115, 120, 131, 147, 176, 185, 209, 211, 222, 237, 246, 292, 302, 388, 497, 526, 560, 897
Cluster: lipoate · cofactor · dithiolane · codon · sulfur · side chain · serine · glutamate · glutamine · LysRS · leucine · peptide

lysosomal hydrolase
Book II Source: VOL subject index
Occurs on (3 mentions, 3 pages): 280, 589, 897
Cluster: lysosome · vacuolar ATPase · ATP · concentration · pump · proton gradient · kinase · kinetic control · knockdown · knockout · KRAS · L shape

lysosomal storage disease
Book II Source: VOL subject index
Occurs on (2 mentions, 2 pages): 556, 897
Cluster: disease · mitochondria · kinase · kinetic control · knockdown · knockout · KRAS · L shape · last universal common ancestor · LDLR · Lesch-Nyhan syndrome · leucine

lysosome
Book I *primary* §114 · *secondary sections* §320, §906 · *pages* 90-91, 311, 553, 1106
Book II Source: VOL subject index
Occurs on (37 mentions, 21 pages): 273, 275, 276, 277, 279, 280, 296, 297, 313, 314, 315, 316, 317, 319, 322, 351, 546, 552, 556, 588, 897
Cluster: organelle · mitochondrion · nucleus · peroxisome · element · plasma membrane · pump · mTORC1 · disease · centrosome · endoplasmic reticulum · Golgi

LysRS
Book II Source: VOL subject index
Occurs on (3 mentions, 3 pages): 185, 186, 897
Cluster: lysine · amino acid · archaea · kinase · kinetic control · knockdown · knockout · KRAS · L shape · last universal common ancestor · LDLR · Lesch-Nyhan syndrome

mcm5s2U
Book I *primary* §433 · *secondary sections* §435, §439 · *pages* 646-647, 650

MDA5
Book I *primary* §296 · *secondary sections* §299, §300, §410, §1097, §1100, §1105, §1106, §1243, §1250, §1252, §1368 · *pages* 531, 534-535, 627, 1219, 1221, 1224-1225, 1323, 1327-1328, 1402
Book II Source: VOL subject index
Occurs on (5 mentions, 4 pages): 138, 323, 491, 897
Cluster: RNA · inosine · knockout · fold · ADAR1 · lipid · maleimide · ADAR · Alu element · jumping gene · ADAT3 · Akt

MDM2
Book II Source: VOL subject index
Occurs on (17 mentions, 11 pages): 319, 321, 325, 348, 349, 351, 361, 364, 580, 584, 897
Cluster: p53 · BAD · LMNA · nucleus · GSK3 · phosphorylation · TP53 · transcription · cascade · caspase · cell cycle · cell survival

measles
Book I *primary* §1574 · *secondary sections* §488, §490, §1571, §1572, §1575, §1576, §1578, §1581, §1584, §1585, §1586, 1587, and 5 more · *pages* 690, 692, 1545-1550, 1552, 1554-1557, 1559, 1564, 1571

measurement hydrogen bond
Book II Source: VOL subject index · color red
Occurs on (1 mentions, 1 pages): 897
Cluster: kinase · kinetic control · knockdown · knockout · KRAS · L shape · last universal common ancestor · LDLR · Lesch-Nyhan syndrome · leucine · library preparation · lifespan

median editing level
Book I *primary* §394 · *secondary sections* — · *pages* 614

MEG3
Book I *primary* §406 · *secondary sections* §409 · *pages* 624, 626

melting temperature
Book II Source: VOL subject index
Occurs on (7 mentions, 6 pages): 65, 141, 257, 263, 409, 897
Cluster: covalent bond · release · substrate · inosine · fold · codon · guanine · hydrogen bond · potassium · kinase · kinetic control · knockdown

membrane contact site
Book II Source: VOL subject index
Occurs on (9 mentions, 9 pages): 36, 281, 296, 542, 556, 581, 592, 609, 897
Cluster: calcium · organelle · compartment · lipid · proximity labeling · mitochondrion · ATP · electron microscopy · genetically encoded sensor · imaging · network · peroxide

membrane potential
Book II Source: VOL subject index
Occurs on (4 mentions, 4 pages): 280, 557, 590, 898

Cluster: assay · endoplasmic reticulum · glycosylation · Golgi · ATP · abundance · flux · imaging · transporter · messenger RNA · metabolic disease · metal center

Mendes
Book I *primary* §454 · *secondary sections* — · *pages* 662

mercaptopyruvate sulfurtransferase
Book I *primary* §56 · *secondary sections* §336, §387 · *pages* 237, 567, 608

messenger RNA
Book II Source: VOL subject index
Occurs on (4 mentions, 4 pages): 117, 131, 593, 898
Cluster: carbon · hydrogen · nitrogen · phosphorus · RNA · sulfur · thymine · codon · DNA · notation · sulfur atom · uracil

metabolic disease
Book II Source: VOL subject index
Occurs on (4 mentions, 4 pages): 97, 333, 611, 898
Cluster: methionine restriction · nucleotide · phosphate · junction · lifespan · model organism · molybdenum cofactor · sulfur · membrane potential · messenger RNA · metal center · metal loading

metal center
Book II Source: VOL subject index
Occurs on (2 mentions, 2 pages): 308, 898
Cluster: cofactor · cysteine · oxygen · radical · radical SAM · ribonucleotide reductase · membrane potential · messenger RNA · metabolic disease · metal loading · metallochaperone · metalloprotein

metal loading
Book II Source: VOL subject index
Occurs on (9 mentions, 8 pages): 5, 149, 227, 232, 399, 518, 548, 898
Cluster: cofactor · disulfide register · occupancy · folding problem · mass spectrometry · backbone geometry · sulfur · alphabet · record · redox poise · assay · differential alkylation

metallochaperone
Book II Source: VOL subject index
Occurs on (1 mentions, 1 pages): 898
Cluster: membrane potential · messenger RNA · metabolic disease · metal center · metal loading · metalloprotein · methionine · methionine cycle · methionine restriction · methotrexate · methyl donor · methyl group

metalloprotein
Book II Source: VOL subject index
Occurs on (4 mentions, 4 pages): 234, 564, 608, 898
Cluster: iron · zinc · biogenesis · disulfide register · manufacturing · occupancy · redox proteomics · thiol · membrane potential · messenger RNA · metabolic disease · metal center

methanethiol
Book I *primary* §50 · *secondary sections* §51, §58, §220, §221 · *pages* 84, 211, 213, 241, 437-438

methionine
Book I *primary* §577 · *secondary sections* §4, §5, §7, §9, §15, §21, §22, §24, §31, §35, §36, 38, and 120 more · *pages* 71, 82, 84, 90, 100-101, 103, 106, 113, 129-130, 134, 144-147, 158-160, 163-166, 187, 206, 229, 231, 233-234, 244, 262, 271, 285-286, 320-322, 391-392, 396, 411-412, 416, 424-426, 430, 440, 460, 475-476, 481, 483-484, 527, 549, 568, 573, 587, 594, 607, 706, 712-713, 737, 771, 774, 777, 782, 918, 920-921, 924, 930-932, 997, 1042, 1045, 1050, 1067, 1088, 1120, 1123, 1126, 1138-1141, 1152-1154, 1156, 1158, 1169, 1171-1172, 1174-1175, 1178, 1180-1181, 1196, 1220, 1266, 1314, 1332, 1354-1356, 1358, 1360, 1409-1410, 1447, 1471, 1474, 1477-1479, 1482-1483, 1485, 1510-1511, 1554, 1573, 1576-1577, 1580-1582, 1591, 1599, 1604-1605, 1651, 1653-1659
Book II Source: VOL subject index · color yellow
Occurs on (85 mentions, 60 pages): 35, 36, 41, 80, 115, 117, 122, 124, 131, 164, 182, 187, 207, 208, 209, 228, 279, 286, 297, 298, 299, 306, 311, 312, 314, 332, 334, 336, 341, 350, 353, 354, 355, 356, 384, 386, 389, 390, 391, 392, 393, 394, 397, 400, 431, 495, 497, 526, 529, 535, 550, 560, 577, 580, 597, 615, 834, 839, 840, 898
Cluster: cysteine · sulfur · S-adenosylmethionine · amino acid · codon · glutathione · sulfur amino acid · sulfonium · transsulfuration · methyl group · mTORC1 · S-adenosylhomocysteine

methionine adenosyltransferase
Book I *primary* §38 · *secondary sections* §927, §938 · *pages* 164-165, 1120, 1126

methionine cycle
Book II Source: VOL subject index · color yellow
Occurs on (7 mentions, 7 pages): 95, 97, 293, 311, 332, 333, 898
Cluster: methyl group · methionine · active-site cysteine · cytosine · cytosine base editor · pyrimidine · sulfur chemistry · thymidylate synthase · thymine · uracil · S-adenosylmethionine · methylation index

methionine restriction
Book II Source: VOL subject index · color yellow
Occurs on (16 mentions, 11 pages): 313, 331, 333, 334, 353, 356, 394, 397, 495, 499, 898
Cluster: lifespan · prediction · Akt · model organism · methionine · allocation · budget · junction · metabolic disease · methyl transfer · sulfur · mTORC1

methotrexate
Book II Source: VOL subject index
Occurs on (4 mentions, 4 pages): 98, 100, 538, 898
Cluster: hydroxyurea · mycophenolate · supply line · nucleotide · objection · membrane potential · messenger RNA · metabolic disease · metal center · metal loading · metallochaperone · metalloprotein

methyl donor
Book II Source: VOL subject index
Occurs on (14 mentions, 13 pages): 28, 34, 60, 90, 293, 304, 336, 337, 340, 341, 529, 597, 898
Cluster: sulfur · cysteine · radical · S-adenosylmethionine · DNA · sulfonium · methionine · element · thioester · wobble position · methyl group · radical SAM

methyl group
Book II Source: VOL subject index
Occurs on (44 mentions, 37 pages): 38, 48, 60, 90, 95, 97, 101, 117, 182, 229, 243, 245, 248, 272, 274, 283, 288, 292, 293, 297, 311, 313, 314, 345, 352, 467, 485, 529, 532, 551, 555, 560, 577, 601, 779, 879, 898
Cluster: S-adenosylmethionine · sulfonium · sulfur · cytosine · thymidylate synthase · methionine · glutathione · active-site cysteine · pyrimidine · thymine · element · oxidative damage

methyl groups
Book II Source: VOL subject index
Occurs on: no mention found in the merged text outside this index.

methyl mark
Book II Source: VOL subject index
Occurs on (8 mentions, 8 pages): 297, 298, 334, 340, 350, 352, 396, 898
Cluster: S-adenosylmethionine · methionine · methyl group · sulfonium · citrate · DNA · histone · histone acetyltransferase · methyltransferase · sulfur · thioester · thiolation

methyl transfer
Book I *primary* §124 · *secondary sections* §175, §509, §824, §920, §1303, §1514 · *pages* 63, 323, 395, 706, 1042, 1115, 1358, 1493
Book II Source: VOL subject index
Occurs on (10 mentions, 8 pages): 287, 334, 388, 390, 496, 527, 597, 898
Cluster: sulfur · acyl transfer · sulfonium · thioester · nucleotide · thiol · cysteine · methionine restriction · coenzyme · cofactor · methionine · methylation index

MT-TL1

Book II Source: VOL subject index

MT-TL1 is a mitochondrial gene encoding a transfer RNA for leucine, tRNA-Leu(UUR), the first of the two leucine tRNA genes in mitochondrial DNA. Mutations in MT-TL1 are linked to mitochondrial disorders, most notably MELAS (mitochondrial encephalomyopathy, lactic acidosis, and stroke-like episodes), which arises when the tRNA fails to charge properly, so mitochondrial proteins are not built.

Occurs on (1 mentions, 1 pages): 909

one-way gate

Book II Source: VOL subject index

Three pathway verbs tell apart the ways material moves through a metabolic pathway. Entrance is the gate, the first point of entry into a pathway, as H2S is the gate through which chemistry on Earth begins. Transit is the passage through the pathway, as in the one-way run from IMP to XMP to GMP, or from OMP to UMP. Loop is circling back, which the de novo purine and pyrimidine synthesis pathways do not do; they are one-way. XMP to GMP is a one-way purine gate and OMP to UMP is a one-way pyrimidine gate; neither can run back as a loop.

Book II Source: VOL subject index · color indigo

Selenocysteine is the 21st protein amino acid. Its selenium is the third element in the oxidation series of oxygen, sulfur, selenium, and it carries a larger electron cloud than sulfur: selenium's electron fill is 2, 8, 18, 6 against sulfur's 2, 8, 6, because selenium's third shell fills the d orbitals that sulfur's never does. Selenocysteine is the working residue of the 25 human selenoproteins, which protect the cell from oxidation in ways the sulfur of cysteine cannot match.

Occurs on (56 mentions, 41 pages): 39, 41, 53, 83, 117, 122, 124, 126, 129, 130, 131, 156, 163, 193, 201, 202, 209, 273, 274, 275, 284, 287, 288, 289, 290, 309, 314, 339, 386, 400, 403, 535, 561, 574, 577, 579, 590, 603, 836, 852, 906

sulfur outline's
Book II Source: VOL subject index · color yellow
The sulfur outline is the entire arc of sulfur across the volume — from the anaerobic world through the Great Oxidation Event to the present — with all its branches into the eighteen sulfur functional groups.
Occurs on (8 mentions, 5 pages): 57, 59, 60, 73, 908
Cluster: plate · twelve conversations · greigite · mackinawite · alphabet · position thirty-four · wobble · thiyl radical · reductant · compartment · mitochondrion · organelle

sulfur prismatic photon color parser
Book II Source: INV register of terms; THEMES concordance · color yellow · themes: T1 T10
Function 17 of the spine plate — the physics item sitting inside the biological run. [PLATE] Connects to the Balmer series of hydrogen, whose longest-wavelength line, the red H-alpha line, anchors experimental hydrogen spectroscopy; and to the seven organic bonds built from hydrogen, carbon, nitrogen, oxygen, phosphorus and sulfur, with sulfur as the sixth atom (H, N, H, C, O, H, C, N, O, P, S). These six atoms make up about 97.5 percent of human body mass and are the atoms from which the human genome and its machinery are built; they are the first principles of why every molecular structure rests on the foundation of these six atoms.
Occurs on (1 mentions, 1 pages): 864

sulfur protein photonic color helical strings
Book II Source: INV register of terms; THEMES concordance · color yellow · themes: T1 T5 T7 T10
The legend of Plates 064 and 065, with atom-photon interactions. [PLATE]

sulfur universal chemical primer
Book II Source: INV register of terms; THEMES concordance · color yellow · themes: T1 T10
Function 30 of the spine plate. [PLATE] The primer: sulfur as the ignition point. It was forged by stellar nucleosynthesis in supernovae, created together with oxygen and phosphorus — the first spark from which everything downstream follows.
Occurs on (1 mentions, 1 pages): 864
Cluster: bacteria · disulfide photochemical interface switch · DNA · mineral · nucleotide · oxidation state · RNA · sulfide · sulfur · sulfur amino acid · sulfur universal genetic primer

sulfur universal genetic primer
Book II Source: INV register of terms; THEMES concordance · color yellow · themes: T1 T10
Function 31 of the spine plate. [PLATE] Reinforces the RNA-to-DNA world: there is only one path, a single metabolic pathway, from the RNA world to the DNA world, through the nucleotide reductase enzyme (ribonucleotide reductase) — the bridge from the old sulfur economy to the new oxidation economy.
Occurs on (1 mentions, 1 pages): 864
Cluster: bacteria · disulfide photochemical interface switch · DNA · mineral · nucleotide · oxidation state · RNA · sulfide · sulfur · sulfur amino acid · sulfur universal chemical primer

sulfurtransferase
Book II Source: VOL subject index
Occurs on (3 mentions, 3 pages): 371, 373, 908
Cluster: sulfur · sulfur atom · thiocarboxylate · dithiolene · intermediate · molybdenum · molybdopterin · monophosphate · pathway · pyranopterin · radical SAM · MOCS2A

sulfurylase

Cluster: CGA · deletion · arginine · codon · xanthinuria · nucleotide · adenine base editor · BRAF · cytosine editor · knockout · prime editing · transition

thalamus switching functions
Book II Source: INV register of terms; THEMES concordance · themes: T6 T10
Function 10 of the spine plate. [PLATE]
Occurs on (3 mentions, 3 pages): 795, 796, 863
Cluster: plate · the spine · bacteria · chromosome · isotope · mineral · sulfate · sulfur

the 1944 maps
Book II Source: INV register of terms; THEMES concordance · themes: T3 T10
Fifteen maps of the lower Mississippi showing every channel the river had ever occupied — the type case of a map that makes visible a quantity earlier surveys structurally omitted. [CURR]
Occurs on (3 mentions, 3 pages): 463, 699, 874
Cluster: addition not substitution · agmatidine · alphabet · ambiguity-widener · anticodon · concession · corpus · geometry · index entry · inosine · network · notation

the 1982 chart
Book II Source: INV register of terms; THEMES concordance · themes: T6 T10
The dated biochemical pathways wall chart against which the omission arguments are run — a specific physical artifact rather than “the literature.” Seven bases, two sugars, three phosphate states. [CURR]
Occurs on (3 mentions, 3 pages): 463, 699, 874
Cluster: pathway · addition not substitution · agmatidine · alphabet · ambiguity-widener · anticodon · concession · corpus · geometry · index entry · inosine · network

the 64-tetrahedron genetic lattice
Book II Source: INV register of terms; THEMES concordance · themes: T7
The 64 cells of the octahedron are built from the eight purine and pyrimidine mononucleotides. The purines branch: IMP to XMP to GMP, and a second branch from IMP to AMP. The pyrimidines run as a linear process, OMP to UMP to CMP to TMP. The lattice is based on that chemistry and its metabolic pathways, not on the genetic code or genetic information. Seven bases, two sugars, three phosphate states. [JUN]
Occurs on (2 mentions, 2 pages): 46, 700
Cluster: ADAR · adenine · cytosine · disulfide switch · DNA · DNA repair · frame-zero · genetic code · hypoxanthine · IMP · inosine · nitrogen

the 76-base tRNA
Book II Source: INV register of terms; THEMES concordance · themes: T2 T8 T9
The molecule counted position by position, so that wobble position 34 can be located rather than asserted. [CDU]
Occurs on (2 mentions, 2 pages): 463, 700
Cluster: wobble position · addition not substitution · agmatidine · alphabet · ambiguity-widener · anticodon · concession · corpus · geometry · index entry · inosine · network

the arabinose test
Book II Source: INV register of terms; THEMES concordance · themes: T3 T7 T12 T13
The test the corpus offers against its own geometry, run on the sugar. [CURR]
Occurs on (6 mentions, 5 pages): 439, 463, 496, 708, 875
Cluster: corpus · geometry · objection · addition not substitution · agmatidine · alphabet · ambiguity-widener · anticodon · concession · index entry · inosine · network

the Berger spinor
Book II Source: INV register of terms; THEMES concordance · themes: T7
The named subject for the topology and arithmetic work. [816, OVR]
Occurs on (3 mentions, 3 pages): 463, 716, 875
Cluster: AUGCIX · geometry · the blue set · thymine

the blue set
Book II Source: INV register of terms; THEMES concordance · themes: T6 T7 T9
The addenda B, C, D and E — the loop geometry, the cosmic arc, the neural arc and the gamete arc. [OVR]
Occurs on (3 mentions, 3 pages): 463, 726, 875
Cluster: geometry · arc · AUGCIX · the Berger spinor · thymine

the cardinal error
Book II Source: INV register of terms; THEMES concordance · themes: T3 T8
Three chemical levels — base, nucleoside, nucleotide — collapsed onto one letter. [CURR]
Occurs on (4 mentions, 4 pages): 464, 476, 727, 875
Cluster: nucleoside · nucleotide

the chemistry generates the color

Book II Source: INV register of terms; THEMES concordance · themes: T12

The rule the whole scheme runs on: the color of a base is the color of the atom that distinguishes it, not a mnemonic chosen for it. [AMB]

Occurs on (3 mentions, 3 pages): 430, 462, 728

Cluster: color key

the city of the shoulders

Book II Source: INV register of terms; THEMES concordance · themes: T9

Chicago, and the thirteen approved programs in the country of which one was there. [MEM]

Occurs on (6 mentions, 6 pages): 457, 464, 510, 728, 729, 875

Cluster: amino acid · codon · outside · oxygen · periodic table · plate · selenium · sulfur · the codon table in full

the codon table in full

Book II Source: INV register of terms; THEMES concordance · themes: T3 T5 T10

All twenty-two amino acids, color-coded, with their hydrophobicity beside them. [CDU]

Occurs on (5 mentions, 4 pages): 456, 464, 730, 875

Cluster: amino acid · codon · outside · oxygen · periodic table · plate · selenium · sulfur · the city of the shoulders

the complete base-pairing rule set

Book II Source: INV register of terms; THEMES concordance · themes: T5

The single table in which every pairing relationship the paper recognizes is stated at once. [CDU]

Occurs on (5 mentions, 4 pages): 77, 456, 633, 730

Cluster: amino acid · guanosine · instrument · shape · supply is not repertoire · the sequence has no · what the notation loses · wobble position

the containment test

Book II Source: INV register of terms; THEMES concordance · themes: T3 T10 T13

The question the modeling generator is scored against: does everything in the volume fit inside the construction. [CURR]

Occurs on (4 mentions, 4 pages): 464, 485, 731, 876

Cluster: consistency of furniture · corpus · cost class · element · objection · shape

the corpus as its own adversary

Book II Source: INV register of terms; THEMES concordance · themes: T3 T13

The standing of the objections Part: the strongest case against the work, reproduced chapter for chapter rather than summarized. [CURR]

Occurs on (2 mentions, 2 pages): 495, 731

Cluster: objection

the dam breaks

Book II Source: INV register of terms; THEMES concordance · themes: T3 T10

The preface’s figure for twenty-five years of ideas held behind an outlet, and the release. [MEM]

Occurs on (8 mentions, 6 pages): 456, 457, 464, 513, 733, 876

Cluster: release

the delivery manifest

Book II Source: INV register of terms; THEMES concordance · themes: T9 T11 T12

The Murchison inventory read as the closest thing available to a manifest for the origin of life. [AMB]

Occurs on (3 mentions, 3 pages): 465, 734, 876

Cluster: inventory · origin of life

the diazoplast

Book II Source: INV register of terms; THEMES concordance · themes: T9 T11

The endosymbiont that carries nitrogenase inside a diatom — a living example of biology working around an atom it cannot replace. [CURR]

Occurs on (5 mentions, 5 pages): 373, 465, 479, 734, 876

Cluster: nitrogenase · oxygen · element · iron · molybdenum · nine to two

the drama triangle

Book II Source: INV register of terms; THEMES concordance · themes: T3 T7

A named subject from the psychological side of the corpus, carried into the volume. [816]

Occurs on (3 mentions, 3 pages): 465, 737, 876

Cluster: corpus · drain and exhale · element · plate · sulfur · the spine

the eighteen functional groups

Book II Source: INV register of terms; THEMES concordance · themes: T1 T3 T7 T10 T13

The standard table of sulfur groups, with the two that have no biological role and the five active classes it omits. [SCN]

Occurs on (9 mentions, 9 pages): 74, 281, 284, 397, 420, 449, 550, 738, 739

Cluster: shape · element · oxidation state · sulfur · mineral · element availability · plate · purpose · separate · molecular cloud · thiyl radical · hydrogen sulfide

the eighth chapter
Book II Source: INV register of terms; THEMES concordance · themes: T1 T2 T3
The chapter on the underestimation of inosine and the substitution of oxygen for sulfur. [AMB]
Occurs on (6 mentions, 6 pages): 45, 429, 465, 739, 788, 877
Cluster: inosine · oxygen · sulfur · ambiguity-widener · genetic code · IMP · oxidation ladder · purine · quantum tunneling · root monomer · the seven-letter seed

the Extreme SSD
Book II Source: INV register of terms; THEMES concordance · themes: T3 T10
The drive whose file tree was photographed to build the subject indexes. [816, 816F]
Occurs on (6 mentions, 5 pages): 427, 465, 741, 869, 877
Cluster: Volume 816 · token-similarity matching at a 0.70 threshold · record · ARCHIVE

the fan, organelle-sorted
Book II Source: INV register of terms; THEMES concordance · themes: T3 T6 T9 T11
Twenty-seven outward arrows from one kinase, filed by the organelle in which each target acts, with the zeros read as informative as the counts. [CURR]
Occurs on: no mention found in the merged text outside this index.

the fault logic controller
Book II Source: INV register of terms; THEMES concordance · themes: T6
The process document: a sixty-three-step launch sequence and a three-law fault protocol held to six sigma. [OVR]
Occurs on (3 mentions, 3 pages): 465, 742, 877

the five-category standard
Book II Source: INV register of terms; THEMES concordance · themes: T13
The epistemic scheme by which claims are sorted before they are argued. [OVR]
Occurs on (1 mentions, 1 pages): 743

the floor, not the total
Book II Source: INV register of terms; THEMES concordance · themes: T9 T10
The standing of any count drawn from one photographed folder of thirteen. [INV]
Occurs on: no mention found in the merged text outside this index.

the geometry of things
Book II Source: INV register of terms; THEMES concordance · themes: T3 T7
What a teacher gave him, named in the chapter title. [MEM]
Occurs on (6 mentions, 6 pages): 456, 466, 505, 746, 760, 877

the grace period
Book II Source: INV register of terms; THEMES concordance · themes: T3
The disclosure interval the volume records, beside absolute novelty. [V329]
Occurs on (3 mentions, 3 pages): 466, 747, 877
Cluster: record

the handle
Book II Source: INV register of terms; THEMES concordance · themes: T5 T11
Adenosine on a cofactor, contributing nothing to the chemistry and everything to recognition. [AMB]
Occurs on (16 mentions, 12 pages): 43, 69, 385, 388, 414, 464, 466, 497, 749, 807, 875, 878
Cluster: cofactor · RNA · adenosine · nucleotide handle · sulfur · donor · catalysis · nucleotide · adenine · sulfonium · coenzyme · dithiolane

the hydrated electron
Book II Source: INV register of terms; THEMES concordance · themes: T1 T3 T11
The prebiotic reductant indexed beside sulfite. [V329]

Cluster: DNA

the official sixes

Book II Source: INV register of terms; THEMES concordance

The named set in the closure document, beside the silent sevenths and the seven prime questions. [MAY] The first principle is the beginning: the six atoms hydrogen, carbon, nitrogen, oxygen, phosphorus and sulfur. The original six comes from the C4N2 rings of the purines and pyrimidines, six atoms in each ring. Carbon, atomic number 6, is the differentiator between organic and inorganic chemistry; it all begins with carbon, which is both the hardest material, diamond, and one of the softest, graphite. The hexagon of the benzene ring is the fundamental structure of organic chemistry. The hydrogen isotope triad (protium H-1, deuterium H-2 and tritium H-3) is the basis of the six-atom scheme and the first atomic transition, where hydrogen connects the gases, then the liquids, then the solids. Hydrogen makes up about 75 percent of the ordinary matter of the universe by mass.

questions · DNA · compartment · junction · mineral

the silent sevenths

Book II Source: INV register of terms; THEMES concordance

The second named set of the closure document. [MAY] The silent seventh refers first to XMP and OMP, the gatekeepers that are not mentioned in the genetic code: they stand outside the vertices and edges of the octahedron, and only the six mononucleotides are part of the octahedron. The seventh also refers to the seventh color indigo, the unseen band of the rainbow spectrum. And selenium is the seventh atom in the sequence that follows the six atoms hydrogen, carbon, nitrogen, oxygen, phosphorus and sulfur. Selenium is not the seventh protein amino acid; selenocysteine is the twenty-first. Selenium is the exact reason the seven exists.

Book II Source: VOL subject index · color indigo
Occurs on (5 mentions, 5 pages): 105, 286, 523, 612, 911
Cluster: xanthine · hypoxanthine · purine · urate · oxidase · xanthine dehydrogenase · adenine · amino acid · ATP · carbon · de novo synthesis · dithiolene

xanthinuria
Book II Source: VOL subject index
Occurs on (17 mentions, 15 pages): 109, 371, 375, 376, 378, 381, 382, 396, 494, 535, 540, 559, 599, 612, 911
Cluster: xanthine · cofactor · sulfite oxidase deficiency · hypoxanthine · sulfite · purine arm · molybdenum cofactor · urate · purine · substrate · sulfur · intermediate

xanthosine
Book I *primary* §443 · *secondary sections* §18, §41, §65, §118, §133, §138, §191, §200, §280, §445, §451, 454, and 24 more · *pages* 119, 178, 188, 253, 316, 341, 345, 348, 352-353, 363, 409, 420, 516, 653-654, 660, 662, 666, 673, 691, 789, 794-797, 813, 830-831, 841-842, 844, 859, 862, 890, 896, 1072, 1097-1098, 1101, 1446, 1565, 1567

xanthosine monophosphate
Book II Source: VOL subject index
Occurs on (12 mentions, 12 pages): 57, 102, 103, 104, 105, 480, 514, 525, 536, 559, 599, 911
Cluster: guanine · inosine monophosphate · orotidine monophosphate · nucleotide · pyrimidine · GMP synthase · IMP dehydrogenase · adenine · de novo purine synthesis · guanosine monophosphate · de novo synthesis · notation

XDP
Book I *primary* §457 · *secondary sections* §463, §464, §651, §652, §661 · *pages* 665, 670-671, 860-861, 871

xeroderma pigmentosum
Book II Source: VOL subject index
Occurs on (2 mentions, 2 pages): 304, 911
Cluster: XPD · cancer · DDX11 · disease · FANCJ · Fanconi anemia · RTEL1 · spectrum · telomere · trichothiodystrophy · uridine · uridine monophosphate

XIAP
Book II Source: VOL subject index
Occurs on (9 mentions, 7 pages): 297, 320, 323, 328, 361, 365, 911
Cluster: apoptosis · Akt · BAD · WFS1 · arrow · calcium · endoplasmic reticulum · junction · organelle · oxygen · sulfur · ATL1

XMP
Book I *primary* §16 · *secondary sections* §17, §18, §33, §40, §41, §63, §64, §65, §118, §119, §133, 191, and 52 more · *pages* 115, 117-122, 125, 151, 172, 175, 178, 181-182, 188, 249, 251, 253, 261, 265, 316-317, 333-337, 341, 345-346, 353, 355-356, 359, 409, 504, 661, 665-666, 671-672, 686, 688, 784-785, 787-790, 795-797, 813, 824, 829, 842, 881, 883-884, 887, 892, 896, 902-903, 992, 1008, 1015, 1031, 1105, 1109, 1168, 1268-1270, 1302, 1354, 1458, 1460, 1565-1567, 1638, 1645, 1650
Book II Source: VOL subject index · color indigo
Occurs on (15 mentions, 11 pages): 105, 112, 379, 453, 466, 468, 481, 868, 877, 880, 911
Cluster: IMP · GMP · AMP · xanthine · purine · pyrimidine · UMP · CMP · gatekeeper · xanthosine monophosphate · inosine · wobble

XPD
Book II Source: VOL subject index
Occurs on (12 mentions, 10 pages): 258, 259, 304, 306, 308, 536, 540, 579, 612, 911
Cluster: DDX11 · FANCJ · helicase · RTEL1 · domain · disease · nucleotide excision repair · telomere · ATPase · xeroderma pigmentosum · DNA · chromatid

XTP
Book I *primary* §24 · *secondary sections* §48, §60, §64, §65, §454, §455, §457, §458, §459, §460, §461, 463, and 11 more · *pages* 133, 205, 244, 251, 261, 688, 763, 859, 871, 892, 896, 899, 1072, 1446, 1564

Y

yeast
Book II Source: VOL subject index
Occurs on (4 mentions, 4 pages): 136, 487, 492, 911
Cluster: frameshifting · pathway · respiration · sulfur · thiolation · anticodon · fold · hypoxanthine · uridine · uridine monophosphate · UUG · V600E

YJR069C
Book I *primary* §454 · *secondary sections* §463 · *pages* 663, 670

Z

z-alpha domain
Book I *primary* §475 · *secondary sections* §476, §478, §479, §1216 · *pages* 680-681, 683-684, 1300

Z-DNA
Book I *primary* §253 · *secondary sections* §291, §299, §300, §476, §629, §630, §635, §645, §646, §648 · *pages* 466, 526, 534-535, 681, 843, 852-853, 856

zero-point energy
Book II Source: VOL subject index
Occurs on (2 mentions, 2 pages): 543, 911
Cluster: hydrogen · tunneling · uridine · uridine monophosphate · UUG · V600E · vacuolar ATPase · valence · validation · validation package · valine · variable arm

ZFP14
Book I *primary* §319 · *secondary sections* §320, §325 · *pages* 552-553, 557

zinc
Book I *primary* §307 · *secondary sections* §4, §37, §60, §123, §133, §231, §308, §312, §313, §318, §319, 320, and 18 more · *pages* 69, 82, 98, 161, 244, 322, 345, 354-355, 447, 542-543, 551-554, 557-559, 566, 569-570, 607, 609-610, 831, 842, 1172, 1179-1181, 1348, 1427-1428
Book II Source: VOL subject index
Occurs on (27 mentions, 23 pages): 3, 30, 48, 50, 234, 235, 273, 275, 276, 297, 301, 315, 318, 336, 340, 395, 396, 548, 554, 574, 576, 591, 911
Cluster: iron · magnesium · element · sulfur · manganese · molybdenum · cysteine · calcium · potassium · Golgi · secretory vesicle · transporter

zinc finger
Book I *primary* §320 · *secondary sections* §231, §307, §321, §325, §339, §340, §385, §1026 · *pages* 447, 542, 553-554, 557, 607, 1179
Book II Source: VOL subject index
Occurs on (4 mentions, 4 pages): 272, 548, 576, 911
Cluster: cysteine · iron-sulfur cluster · zinc · dithiolene · molybdenum · thiolate · histidine · motif · carrier · molybdenum cofactor · uridine · uridine monophosphate

zinc-finger protein
Book I *primary* §307 · *secondary sections* §308, §312, §313, §320, §321, §335, §385, §387 · *pages* 542-543, 546-547, 553-554, 566, 607, 609

ZNF195
Book I *primary* §385 · *secondary sections* — · *pages* 607

ZNF415
Book I *primary* §385 · *secondary sections* — · *pages* 607

ZNF573
Book I *primary* §385 · *secondary sections* — · *pages* 607

ZNF699
Book I *primary* §335 · *secondary sections* — · *pages* 566

Z-RNA
Book I *primary* §1098 · *secondary sections* — · *pages* 1220

Z-scheme
Book I *primary* §246 · *secondary sections* §252 · *pages* 459, 464

zygote
Book I *primary* §1201 · *secondary sections* §1208, §1210, §1343 · *pages* 1290, 1294-1296, 1382

Contents

About this edition F-3

Book I · PP-2026-MASTER-01 v332 I-1

Title, front matter and contents of Book I I-1
Contents of Book I I-5
Preface · The Band and the Wall I-65
The Four-Letter Problem · A Cause and Effect Analysis I-73
Preface · Where Sulfur Is Not the Answer I-81
Preface · The Wall I-83
The Book Script · The Quaternion Drama I-87
Part One · Sulfur, At Every Scale I-95
Part Two · Sulfur and Oxygen, the Conjugate Pair I-109
Part Three · The Molecule With No Letter I-115
Part Four · The Algebra of the Purine Loop I-117
Part Five · The Encoding I-126
Part Six · The Proton and the Carbonyl I-127
Part Seven · The Enzyme That Made DNA I-128
Part Eight · RNA1 to DNA to RNA2 I-131
Part Nine · What Was Taken Away I-134
Part Ten · Arrow Zero — RNA1 to DNA I-142
Part Eleven · Arrow One — DNA to DNA I-148
Part Twelve · Arrow Two — DNA to RNA2 I-150
Part Thirteen · Arrow Three — RNA2 to Protein I-153
Part Fourteen · The Marks I-157
Part Fifteen · The Sulfur Economy of the Cofactors I-162
Part Sixteen · The Atomic Level I-166
Part Seventeen · The Seven-Letter Seed I-174
Part Eighteen · The Sulfur-Nitrogen Bond I-189
Part Nineteen · Where Recognition Actually Happens I-191
Part Twenty · The Protein Test I-196
Part Twenty-One · What the Notation Cannot Write I-202
Part Twenty-Two · Twenty-Two and Twenty-Two I-204
Part Twenty-Three · The Geometry of the Table I-207
Part Twenty-Four · The Sulfur Lineage I-210
Part Twenty-Five · What the Dogma Does Not Say I-241
Part Twenty-Six · The Energy Budget and What Remains Open I-246
Part Twenty-Seven · Nine Experiments That Would Settle It I-250
Part Twenty-Eight · The Full Experimental Program I-252
Part Twenty-Nine · Status and Standing I-267
Part Thirty · The Bond That Predates the Planet I-268
Part Thirty-One · The Theory of Three I-274
Part Thirty-Two · The Join I-281
Part Thirty-Three · The Turn, the Hot Spot and the Drug I-290
Part Thirty-Four · SO(3) and the Induction I-295
Part Thirty-Five · Sulfur and the Pentose Sugars I-300
Part Thirty-Six · The Berger Atomic Molecular Cellular Modeling Generator I-306
Part Thirty-Seven · Orotate, the Two Currencies, and the Extended Ladder I-315
Part Thirty-Eight · The Revision to Six I-324
Part Thirty-Nine · The Berger Nucleotide Code I-332
Part Forty · The Triplex Nervous System I-338
Part Forty-One · The Charts, and What They Settle I-360
Part Forty-Two · What the Color Count Found on the 1982 Map I-367
Part Forty-Three · The Ferroptosis Landscape I-375
Part Forty-Four · The Bifurcation I-382

Part Forty-Five · The Panel That Is Not Only About Amino Acids I-388
Part Forty-Six · The One Cobalt I-394
Part Forty-Seven · The One Yellow on the Nucleotide Panel I-399
Part Forty-Eight · The Closure Rule I-405
Part Forty-Nine · The Eight on the Cube I-418
Part Fifty · The Element Itself I-427
Part Fifty-One · Before the First Cell I-435
Part Fifty-Two · The Mineral Thread I-442
Part Fifty-Three · Chromatium Vinosum I-449
Part Fifty-Four · The Two Photosyntheses I-457
Part Fifty-Five · Light, Fractals and Color I-464
Part Fifty-Six · Materials and the Environmental Record I-472
Plates · The Wall, Photographed I-479
Part Fifty-Seven · The Quaternion and the Code I-505
Part Fifty-Eight · Nucleotide Metabolism and Disease I-513
Part Fifty-Nine · The Editor I-523
Part Sixty · The Alu Engine I-535
Part Sixty-One · The Recruitment Element I-548
Part Sixty-Two · The Chemical Erasure I-559
Part Sixty-Three · The Record I-572
Part Sixty-Four · The Precursor I-589
Part Sixty-Five · The Recursion I-599
Part Sixty-Six · The Bulk and the Exceptions I-610
Part Sixty-Seven · The Sliver, in Disease I-621
Part Sixty-Eight · Driving the Editor I-632
Part Sixty-Nine · The Wobble Position I-642
Part Seventy · The Case for Eight I-652
Part Seventy-One · The Enzyme That Reads the Missing Symbols I-662
Part Seventy-Two · The Nine Tissues I-673
Part Seventy-Three · The Four-Step Road I-684
Part Seventy-Four · The Origin I-694
Part Seventy-Five · The Modified Ribosome I-703
Part Seventy-Six · The Three-Domain Census I-713
Part Seventy-Seven · The Heptad I-726
Part Seventy-Eight · The Man Who Broke It I-740
Part Seventy-Nine · The Provenance I-757
Part Eighty · Two Mutations in One Gene I-771
Part Eighty-One · The Crossed Graphs I-784
Part Eighty-Two · The Wobble Paper I-797
Part Eighty-Three · The Branch Point Enzyme I-811
Part Eighty-Four · The Immortal Strand I-828
Part Eighty-Five · The Glutamate Receptor I-844
Part Eighty-Six · The Sanitizer I-858
Part Eighty-Seven · The Ratio I-873
Part Eighty-Eight · Six Hundred and Forty-Two Fold I-888
Part Eighty-Nine · The Missing Base I-903
Part Ninety · The Axis at Thirty-Seven I-917
Part Ninety-One · Thirty Seconds I-934
Part Ninety-Two · Forty and Sixty-Five I-947
Part Ninety-Three · The Other Oxygen I-961
Part Ninety-Four · Both Faces I-972
Part Ninety-Five · The Last Purine I-984
Part Ninety-Six · The Antigen That Isn't There I-1001
Part Ninety-Seven · The Door They All Come Through I-1013
Part Ninety-Eight · The Empty Cupboard I-1029
Part Ninety-Nine · The Map and the Marks I-1040
Part One Hundred · The Shape With No Shadow I-1051

Part One Hundred and One · The Letters and the Ledger I-1065
Part One Hundred and Two · The Period Belongs to the Particle I-1077
Part One Hundred and Three · The Mark Decides Where I-1087
Part One Hundred and Four · The Step Where the Chemistry Is Converted I-1095
Part One Hundred and Five · The Map Has No Third Dimension I-1102
Part One Hundred and Six · The Atom That Holds the Charge I-1110
Part One Hundred and Seven · The Carrier Is Always Adenosine I-1119
Part One Hundred and Eight · Speed or Record I-1127
Part One Hundred and Nine · The Chain Is Held on a Sulfur I-1134
Part One Hundred and Ten · Aimed by Letters I-1142
Part One Hundred and Eleven · The Anticodon Is a Guide I-1152
Part One Hundred and Twelve · The Sequence Has No Shape I-1159
Part One Hundred and Thirteen · Four Bands, One Field I-1166
Part One Hundred and Fourteen · Sulfur and the Protein I-1174
Part One Hundred and Fifteen · Sulfur and the Furnace I-1181
Part One Hundred and Sixteen · Sulfur and the Sugar and the Hormone I-1188
Part One Hundred and Seventeen · Sulfur and the Nucleic Acid I-1195
Part One Hundred and Eighteen · Sulfur and the Dividing Cell I-1202
Part One Hundred and Nineteen · The Systematic Names I-1209
Part One Hundred and Twenty · The Tool Is Made From the Target I-1217
Part One Hundred and Twenty-One · The Interior That Never Changed I-1226
Part One Hundred and Twenty-Two · The Climb, and What Decides When I-1235
Part One Hundred and Twenty-Three · Where the Seven Came From I-1244
Part One Hundred and Twenty-Four · Wobble Was an Error First I-1254
Part One Hundred and Twenty-Five · The Parent, Not the Waypoint I-1262
Part One Hundred and Twenty-Six · The Verdict Is Not in the Codon I-1271
Part One Hundred and Twenty-Seven · The Atom That Makes Thymine, and the Atom That Poisons It I-1280
Part One Hundred and Twenty-Eight · Two, One, Zero I-1288
Part One Hundred and Twenty-Nine · The Tetrad With a Hole In It I-1297
Part One Hundred and Thirty · The Pawl Is Made of Sulfur I-1310
Part One Hundred and Thirty-One · The Hiding Place I-1322
Part One Hundred and Thirty-Two · One Gene, Two Diseases I-1331
Part One Hundred and Thirty-Three · What Cannot Be Deleted I-1338
Part One Hundred and Thirty-Four · The Pharmacy Is Built From Two Atoms I-1346
Part One Hundred and Thirty-Five · The Two Currencies I-1354
Part One Hundred and Thirty-Six · One Free Thiol I-1361
Part One Hundred and Thirty-Seven · Predicted I-1369
Part One Hundred and Thirty-Eight · The Protein That Is Not in the Gene List I-1376
Part One Hundred and Thirty-Nine · Two Codes in One Cell I-1387
Part One Hundred and Forty · The Reader, the Demand, and the Population I-1397
Part One Hundred and Forty-One · Twenty-One Genes With No Pathway I-1408
Part One Hundred and Forty-Two · The Ring That Decides I-1416
Part One Hundred and Forty-Three · The Receptor Reached From Both Sides I-1424
Part One Hundred and Forty-Four · The Bond Was Older Than the Code I-1432
Part One Hundred and Forty-Five · The Same Two Atoms, Three Times Over I-1441
Part One Hundred and Forty-Six · The Window Was Made of Lipid I-1449
Part One Hundred and Forty-Seven · The Nucleotide Decides Where the Nitrogen Goes I-1456
Part One Hundred and Forty-Eight · The Protein That Cuts Itself Out I-1461
Part One Hundred and Forty-Nine · Both Theories, Both Ends I-1469
Part One Hundred and Fifty · The Particle That Fathered the Transposon I-1476
Part One Hundred and Fifty-One · The Bar Code Has Two Channels I-1485
Part One Hundred and Fifty-Two · Nine Billion Letters, Four Characters I-1499
Part One Hundred and Fifty-Three · The Unit Is a Nucleotide, Not a Letter I-1521
Part One Hundred and Fifty-Four · The Arabinose Test I-1530
Part One Hundred and Fifty-Five · Read as Guanosine I-1545
Part One Hundred and Fifty-Six · Two Hands, One Signal I-1557

Part One Hundred and Fifty-Seven · The Bracket, Not the Chain I-1572
Part One Hundred and Fifty-Eight · From a Star to a Wrinkle I-1582
Part One Hundred and Fifty-Nine · The Number the Notation Produces I-1596
Part One Hundred and Sixty · The Currency Is a Letter I-1601
Part One Hundred and Sixty-One · QT Is the Marker, Calcium Is the Trigger I-1605
Part One Hundred and Sixty-Two · The Gene That Broke Twice I-1610
Part One Hundred and Sixty-Three · Adenosine for Inosine I-1614
Part One Hundred and Sixty-Four · One Chemistry, Two Addresses I-1620
Part One Hundred and Sixty-Five · Two Deaminations No Sequence File Can Write I-1626
Part One Hundred and Sixty-Six · Oxygen Is the Pivot I-1633
Part One Hundred and Sixty-Seven · Metabolic and Informational Loop of Inosine I-1643
Part One Hundred and Sixty-Eight · Three Codons I-1652
Part One Hundred and Sixty-Nine · The Flat Map I-1661
Appendix A · The Working Library I-2463
Combined Register of the Berger 816 Subjects (Appendix B of Book I, with items 17 and 18 of Book II) R-1
Appendix C · The Derivative Papers I-2503
Index of Book I, now in the Unified Index IX-1
Part One Hundred and Seventy · The Element with No Letter I-1672
Part One Hundred and Seventy-One · The Color Count and the Handedness Switch I-1692
Part One Hundred and Seventy-Two · The Color Count on the 1982 Map I-1720
Part One Hundred and Seventy-Three · Master Outline, Renumbered I-1731
Part One Hundred and Seventy-Four · Pattern Report: A Computational Corpus Analysis I-1749
Part One Hundred and Seventy-Five · The Four-Letter Problem: Cause and Effect I-1762
Part One Hundred and Seventy-Six · Inosine Is Written As Guanine I-1773
Part One Hundred and Seventy-Seven · The Eight Layers I-1777
Part One Hundred and Seventy-Eight · Not Conventional Wisdom I-1784
Part One Hundred and Seventy-Nine · The Objection Was Right I-1788
Part One Hundred and Eighty · The Other Deamination I-1793
Part One Hundred and Eighty-One · The Same Reaction Twice I-1797
Part One Hundred and Eighty-Two · The Vote Is Half Right I-1810
Part One Hundred and Eighty-Three · Three Posts on What AlphaGenome Is I-1814
Part One Hundred and Eighty-Four · For the Ones Who Waited I-1833
Part One Hundred and Eighty-Five · Where the Papers Actually Went I-1860
Part One Hundred and Eighty-Six · The Fifteen Criteria, Applied I-1878
Part One Hundred and Eighty-Seven · Berger Principles and Criteria I-1903
Part One Hundred and Eighty-Eight · Sixteen Questions to Ask Any Model of the Genome I-1946
Part One Hundred and Eighty-Nine · TIGR-Tas and CRISPR-Cas9: The Atoms Always Decide I-1970
Part One Hundred and Ninety · Selenium, the Seventh Atomic Element Which Expanded the Genetic Code I-2006
Part One Hundred and Ninety-One · The Berger Validity Audit: The Scoring Guide I-2021
Part One Hundred and Ninety-Two · The Quantum Blind Spot I-2038
Part One Hundred and Ninety-Three · The 6+1 Process, Examined I-2050
Part One Hundred and Ninety-Four · The Coming Drug Plague, Examined I-2065
Part One Hundred and Ninety-Five · The Quantum Blind Spot, Examined I-2080
Part One Hundred and Ninety-Six · Eighty Candidates for Gene Editing I-2095
Part One Hundred and Ninety-Seven · The Complete Readout I-2105
Part One Hundred and Ninety-Eight · The Non-Commuting Molecule I-2111
Part One Hundred and Ninety-Nine · Order Is Geometry I-2116
Part Two Hundred · Twelve Questions: A Field Instrument I-2123
Part Two Hundred and One · Shape Is Function, 2nd Edition I-2133
Part Two Hundred and Two · Gene and Epigenetic Editing I-2145
Part Two Hundred and Three · The Sulfur Economy of Today I-2164
Part Two Hundred and Four · The Amine Tubulin Can See I-2176
Part Two Hundred and Five · What the Editor Actually Writes I-2190
Part Two Hundred and Six · Why the Cytosine Editor Cannot Fix Tay-Sachs I-2197

Part Two Hundred and Seven · Two Deaminases, One Disease I-2202
Part Two Hundred and Eight · Is Tay-Sachs a Metabolic Disease or a Genetic One? I-2209
Part Two Hundred and Nine · Sulfur and Xanthine Supply the Purine Terminus I-2214
Part Two Hundred and Ten · Sulfur and Neurodegeneration I-2231
Part Two Hundred and Eleven · Sulfur Is Us I-2253
Part Two Hundred and Twelve · Tay-Sachs Consolidated I-2266
Part Two Hundred and Thirteen · The Mystery of HAR1 I-2282
Part Two Hundred and Fourteen · Color as Meaning I-2296
Part Two Hundred and Fifteen · Primordial I-2300
Part Two Hundred and Sixteen · The Sulfur Wedge I-2308
Part Two Hundred and Seventeen · The Editing Window Problem I-2321
Part Two Hundred and Eighteen · The Inheritance of Bonds I-2337
Part Two Hundred and Nineteen · The Sulfur Line I-2345
Part Two Hundred and Twenty · The Element on Both Sides I-2361
Part Two Hundred and Twenty-One · Two Doors I-2365
Part Two Hundred and Twenty-Two · From Jumping Genes to Sulfur Bonds I-2369
Part Two Hundred and Twenty-Three · Deleting a Hydrogen Bond I-2383
Part Two Hundred and Twenty-Four · Unit Quaternions as Photonic Unitaries I-2389
Part Two Hundred and Twenty-Five · What a Rare Tautomer Costs You I-2394
Part Two Hundred and Twenty-Six · Vertical Quaternion Accelerator I-2400
Part Two Hundred and Twenty-Seven · From BCL-2 to Selenium I-2406
Part Two Hundred and Twenty-Eight · Reading ART I-2413
Part Two Hundred and Twenty-Nine · The Uncertain Glyph I-2420
Part Two Hundred and Thirty · The Eight Ladders I-2426
Part Two Hundred and Thirty-One · Unification of Central Dogma Theory I-2435

Book II · PP-2026-VTI-01 · Volume + Themes + Inventory II-1

1. Front matter, color keys, abstracts and the full chains II-3
2. Method and the record: the count, the run, the listing II-12
3. The frame and the arc in twelve stages II-27
4. The nucleotide and the alphabet (with new Plate N-1, the nucleotide octahedron) II-93
5. The charging systems and the twenty-one plates II-155
6. What the record cannot carry II-218
7. Sulfur in command II-271
8. The network, the fan and the clinic II-348
9. The thirteen themes, the weave and the six threads II-405
10. The documents entered into the record, and the chapters item by item II-424
11. Appendices of the volume (A–AC) II-458
12. Claims, hypotheses, predictions and falsifiers II-614
13. Consolidated registers, indexes and concordance II-633
13.8 Consolidated subject-term index (linked), now in the Unified Index IX-1

Unified Index IX-1

This combined master brings two volumes into one file. Book I is PP-2026-MASTER-01 v332, The Scientific Arc of Man's Evolution from the Big Bang to the Human Genome. Book II is PP-2026-VTI-01, the merged Volume + Themes + Inventory edition. The two source files are unchanged; this is a separate volume.

Every page keeps its own book's number with a prefix: I- for Book I and II- for Book II. The Combined Register is numbered R- and the Unified Index IX-, and these front pages F-.

Nothing in either book has been reworded, with these exceptions. The licence wording in both books has been replaced by the copyright notice printed on the page before this one, and the same notice now stands in every footer. Where the notice is longer than the words it replaces, the rest of that paragraph has been reset in place, in a smaller size where the space required it.

The parts that both books carry in their own form have been joined. Appendix B of Book I and items 17 and 18 of Book II form the Combined Register. The Index of Book I and section 13.8 of Book II form the Unified Index. Every row and every entry of the four sources is kept word for word. Book II pages 833 and 861, which carried the beginning and the end of items 17 and 18, now carry a one-line pointer to the Combined Register.

Links have been repaired throughout. The Index buttons, the return arrows and the shaded terms of Book I, which in the source file pointed to page 1, now lead to the Unified Index, and every link into a register or an index leads to its new place. The repetition already inside each book has been left as it stands.

Berger Scientific Connectome

The connectome, the book, the method, the session, the origin - in that order.

PP-2026-COMP-01 v1 · 1 November 2026 · John Allen Berger, Ph.D · NovagonDNA

color	element	base	where it appears in this paper
red	hydrogen · H 1	adenine	no role in this paper
blue	carbon · C 6	cytosine	no role in this paper
green	nitrogen · N 7	guanine	no role in this paper
orange	oxygen · O 8	hypoxanthine · inosine	oxygen, in the worked example
purple	phosphorus · P 15	uracil	no role in this paper
yellow	sulfur · S 16	thymine	sulfur and cysteine, in the worked example and the ladder
indigo	selenium · Se 34	xanthine · orotate	no role in this paper

Color is a pale field behind the word, never colored type, and it names an element and nothing else.

Abstract. The Berger Scientific Companion is a scientific reference book of 3,543 pages, built to be queried rather than read. It holds 2,680 numbered sections and 143,720 internal links. This manual sets out how to work it: how to frame a question the book can close on, how to run the Berger octave loop of who, what, where, when, how and why, how the seventh question finds the gap the first six leave, how the three passes separate the answer from its standing and its hole, and how to divide the work between the reader and a retrieval machine. The output of a session is not a fact. It is an experiment.

Part I. Scientific Knowledge Connectome

A connectome is the complete wiring map of a nervous system. Every cell, and every connection each cell makes. The cells alone tell you almost

nothing. The wiring is where the behavior lives.

Scientific knowledge has the same shape. The facts are the cells. The connections between them are the wiring, and the wiring is almost never drawn. Each field keeps its own facts in its own journals and its own vocabulary. Nobody owns the map between them.

The Companion is an attempt at that map. The 143,720 internal links are its wiring. The five sections below are how you work it.

This is the real descriptor of what the volume is about. Its shape, its size, its function, its process. Its dimensions, its rotations, its twist, its quaternions. Its geometry: linear, planar, bond angles.

Biological machinery. Micromachines. Enzymes, proteins, lipids, fats, carbohydrates, sugars, cofactors, vitamins, minerals.

Animal, vegetable. Plants, herbs, flowers, trees, branching. The nervous system. Blood, arteries, vessels, veins. Rivers, flow. Kidney loops and tubes, water management, pressure release.

Salts, metals, soft metals. The atomic elements and the periodic table. Physical constants and algorithms.

1. Exploration

Exploration is the second way to use the book. The first way is the query: you bring a question and the loop closes on it. Exploration has no question at the start.

You open the volume at a section and follow a link. Then another. You are not looking for an answer. You are looking at what sits next to what.

This is not idleness. A query can only find what your question already reaches toward. You cannot ask about a connection you have never imagined,

and the connections you have never imagined are the ones worth having. Exploration is how you find the question that the query will later answer.

Set a rule before you start so the session ends: follow ten links, or follow links for twenty minutes. Write down every pairing that surprises you. Most will be nothing. One or two will become questions.

2. Edge

The edge is where the literature stops.

Every field has one. It is rarely marked, because a paper reports what was found, not what was not looked for. The edge shows itself in negative space: a mechanism everyone cites and nobody measured, a figure from one experiment in 1974 that has been quoted ever since, a step that every review draws as an arrow.

The seventh question is an edge detector. When an answer comes back verified and complete but not validated, you have found an edge. The literature is consistent there and has not been tested there.

Mark every edge you find, even when it is not the edge you came for. Edges do not move often. The one you log today is still there next year, and it is where experiments come from.

3. Domain adjacent

The answer to a question in one field often sits in the field next door.

The fields do not talk. A sulfur chemist and a retinal specialist read different journals, attend different meetings, and use different words for the same molecule. A fact that is ordinary in one is unknown in the other. Nobody is hiding it. The two literatures simply never touch.

Domain adjacent is the deliberate move across that line. You have a question in field A. Before you conclude the answer does not exist, you ask which field handles the same chemistry, the same geometry, or the same failure mode under a different name, and you go look there.

The volume crosses these lines on purpose. Sulfur runs through 1,581 of its pages, and those pages sit in geology, in biochemistry, in cell biology, and in medicine. That is one atom read across four fields that do not cite each other.

When you run the octave, ask the adjacency question at *where*. Where does this take place is not only a location in the cell. It is also a location in the literature.

4. Mapping connections

A connection is a claim, and it gets recorded like one.

When you find that two things connect, write down four items: the two sections, what kind of connection it is, and what would break it. A connection with no breaking condition is an association, not a finding.

The kinds worth separating:

- **Shared mechanism.** The same chemistry does the work in both places.
- **Shared constraint.** Different mechanisms, the same limit on both.
- **Sequence.** One is upstream of the other.
- **Analogy.** The shapes match and nothing physical is shared. Useful for thinking, never evidence.

Keep analogy in its own category and label it every time. An analogy that loses its label becomes a mechanism in somebody's head within two readings.

5. Knowledge networks

The map is worth more than any node on it.

A fact answers one question. A connection answers a class of questions, because it carries you from a field where you are stuck to a field where the work is already done. That is why the wiring is the asset.

The network also shows you things no single section can. A node with many links into it is load-bearing: if it is wrong, a great deal moves. A node with one link is either a dead end or an unexplored direction, and the two look identical until somebody goes down it. A region with dense internal links and almost nothing crossing out of it is a field talking to itself.

What the Companion is building is this: a network of scientific knowledge where the connections are written down, so the next person does not have to rediscover each one by accident. The facts are already published. The map is not.

Part II. The Book

6. What this book is

The Berger Scientific Companion is a lookup table. You query it. You do not read it.

A book you read has a first page and a last page. The author sets the order. The Companion has no such order. It has 2,680 numbered sections and 143,720 internal links. Every section is an entry point. You arrive wherever your question lands, and the links carry you out from there.

It is a scientific answering machine. You bring a question. It returns the answer and the section the answer sits in. Then it shows you where the answer runs out.

That last part is the reason the book exists. Most reference work stops at retrieval. You look up a fact, you get a fact, you close the book. The Companion does not let you stop there. It requires you to name which part of your answer is unsupported before you use the answer.

7. What is in it

These are the numbers on record. Where this manual gives a figure, that figure is the fact.

item	figure
pages	3,543
numbered sections	2,680
internal links	143,720
file size	79 MB
books in the volume	2

The file is NovagonDNA_Combined_Master_v332.pdf. Book I is PP-2026-MASTER-01. Book II is PP-2026-VTI-01. The title of the volume is *The Scientific Arc of Man's Evolution from the Big Bang to the Human Genome*.

The volume is deposited at Zenodo under concept DOI 10.5281/zenodo.23827226. The repository is github.com/drjab699-jab/scientific-arc.

The book is color-coded and hyperlinked throughout. Most Parts close with the same four blocks: what this Part claims, what this Part refuses, what would show this Part is wrong, and the experiment this Part generates. The

experiments are numbered and run in their own series.

Part III. The Method

8. Bring a question, not a topic

The loop runs on questions. It stalls on topics.

“Sulfur” is a topic. It returns 1,581 pages. You cannot audit 1,581 pages.

“Why does the cell keep a radical parked on a cysteine in ribonucleotide reductase?” is a question. It has a subject, a verb, and a thing you do not yet know. The loop can close on it.

Test your question before you run it.

1. Does it name one thing? If it names three, you have three questions. Run them one at a time.
2. Does it ask something you do not already know? A question you can answer from memory returns a confirmation, and a confirmation teaches you nothing.
3. Could the answer be wrong? If no answer to it could be wrong, it is not a question. It is a definition. Look it up and move on.

If you cannot get your question down to one sentence, you have not finished thinking about it yet. Think about it. Then come back.

9. The Berger octave loop

Six questions in a ring: who, what, where, when, how, why, and beginning again at who. Each one opens into its own set.

- **Who?** Who is the person? Who is the place? Who is the thing?

- **What?** What is the purpose? What is the reason? What is the expectation?
- **Where?** Where does it take place? Here, there, someplace else.
- **When?** When does it occur? Past, present, future.
- **How?** How do you do it? What is the process? What is the sequence? What is the structure? What is the function? What is the shape?
- **Why?** Why are you doing it this way? Why did you make your process choices? What are the first principles you are trying to explain or look up?

Ask all six. Do not skip the one that looks obvious. The question you skip is usually the one holding the gap, because you skipped it on an assumption you never checked.

Write the six answers down. You need them side by side for the seventh question.

10. The seventh question

Which one of these six questions is not verified, complete, or validated?

This is the engine of the loop. The first six retrieve. The seventh finds the hole.

The three words are three different tests. Run each of them on each of your six answers.

test	what it asks	what a failure looks like
verified	Is there a source behind this, and did you open it?	The answer traces back to a review that cites a review. Nobody opened the measurement.
complete	Does the answer cover the whole question, or part of it?	The *how* covers the process and says nothing about the shape.

validated	Has anyone tested this against the world, or is it only consistent?	The mechanism is coherent on paper and no experiment has touched it.

An answer can pass one test and fail another. A number measured once in 1974 and quoted ever since is verified and not validated. A mechanism everyone agrees on with no measurement under it is complete and not verified.

Name the weak one out loud. Write it in the margin, in the file, in the note. An unmarked gap is worse than no answer, because you will build on it.

11. Run it three times

One pass is a lookup. Three passes are an audit. Each pass asks the same six questions of a different object.

Pass one asks about the subject. You put the six questions to the thing you came to find out about. The sections give you what they have. You come out with an answer.

Pass two asks about the answer. Same six questions, new object. Who established this. What was the purpose of establishing it. When was it settled, and has anything moved since. How was it measured. Why is it stated this way. You come out with the answer's standing in the literature.

Pass three asks about the gap. Now the seventh question has something to work with. You know the answer and you know where it came from, so you can see which of the six is thin. This pass produces the experiment.

Do not collapse the passes. Pass two feels redundant the first few times you run it, and it is where most of the work gets done. An answer you have not asked *who* and *when* about is an answer you have taken on trust.

12. The theory of threes and the bonding partner

Two more checks run on every answer.

The theory of threes. Past, present, future. X, Y, Z. Breadth, length, height. Nothing in the world is one-dimensional, and an answer that holds at one time or along one axis is not an answer about a thing. It is an answer about a slice. Put the third dimension on it and see whether it survives.

The bonding partner. Nothing in biology stands alone. For every answer, ask what it is bonded to, and then walk the ladder.

Atoms, molecules, cells, types, tissues, organs, glands. Chemical, biochemical, biology, molecular biology. Genetic information, genetic code. Nervous system, nerves, senses, inference. Sight, sounds, smells, tastes: sweet, sour, bitter, salty, umami.

Walk it up and walk it down. A chemical answer with no cell behind it is a loose end. A clinical answer with no atom under it is a loose end. An answer that exists at one rung and nowhere else is not finished, and the rung where it breaks is where your next question lives.

The sulfur thread through the volume is this ladder worked all the way out. One atom, tracked from its electron shell to a disease, with no rung skipped in between.

Part IV. The Session

13. Using the Companion with a machine

No person holds 2,680 sections in working memory. No specialist in any one of the fields this volume crosses holds them either. The book needs a retrieval organ, and that is what the machine is for.

The division of labor is fixed.

you supply	the machine supplies
the question	the sections that bear on it
the judgment about what matters	the section numbers and the text
the decision about what is load-bearing	a plain report of which of the six questions came back unsupported
the next experiment	the check against the published literature

The machine finds and returns. It does not decide what is important. That rule is not politeness. A retrieval system that ranks findings by its own sense of significance hands you the consensus every time, and the consensus is exactly what the seventh question is built to interrogate.

How to run a session. Give the machine the question in one sentence. Tell it which pass you are on. Have it pull sections by number and quote them back with the numbers attached. At the end of each pass, ask it directly which of the six came back unsupported, and have it say so plainly.

What to refuse from the machine. An answer with no section number. A summary that smooths over a disagreement between two sections. A confident statement where the volume is silent. Silence in the volume is a finding, not a failure, and the machine reports it as silence.

14. A worked example

The question. Why does ribonucleotide reductase park a radical on a cysteine?

Pass one, the subject. The loop goes to §4, Sulfur and the Electron. Who: the enzyme, and the sulfur atom holding the unpaired electron. What: the purpose is to pull the 2′ hydroxyl off a ribonucleotide and make a deoxyribonucleotide. Where: in the cell, at the step where RNA chemistry becomes DNA chemistry. When: before DNA existed as a storage molecule, and in every dividing cell since. How: the radical sits on sulfur because sulfur's outer electrons are loosely held and the atom tolerates an unpaired electron that oxygen does not. Why: the cell needs a radical it can park and retrieve, not one that destroys whatever it touches.

The answer: sulfur's polarizability makes it a stable seat for a radical.

Pass two, the answer. Who established the polarizability figure, and when. Was it measured in the enzyme or in a model compound. Has anything moved since. Here the loop finds that the chemistry is old and settled, and that the measurements come from model systems rather than from the enzyme at work.

Pass three, the gap. Run the seventh question across the six. *How* is verified and *how* is complete. *How* is not validated in the enzyme itself. That is the thin one.

The output. Not a fact. An experiment: measure the radical's seat in the working enzyme, not in the model compound. The Parts of the volume end on exactly this kind of statement, and they number them. Experiment Sixty-Three sits at §1400.

Notice what the session produced. It started as a lookup and ended as a piece of work somebody can do at a bench. A session that produces only confirmations has not used the book.

15. House rules

1. **Query it. Do not read it.** Bring a question, not a topic.
2. **Cite by section, not page.** Sections are stable. Pages drift. In Book I the PDF page runs about five ahead of the printed folio, so PDF 1423 is printed I-1418. Write §4, not p.103.
3. **The numbers on record are the facts.** Where the volume gives a figure, use that figure. Do not round it, soften it, or replace it with one you remember.
4. **Run the octave three times.** Answer, context, gap. No shortcuts through pass two.
5. **Walk the scale ladder.** An answer that lives at one rung is not done.
6. **End on the gap.** Name which of the six came back unsupported. That is the output of the session.
7. **Silence is a finding.** If the volume does not treat something, say so and mark it. An absence is a place to work.

On searching the file: run pdftotext with the layout flag on the PDF and grep the result. The whole book never has to be loaded. Section headings carry a number, a period and the heading text.

Part V. The Origin

16. Where the book came from

John Allen Berger started with over 4,000 scientific medical books bought throughout every Big Ten university in the late 1990s and early 2000s. He went from campus to campus. He looked at every table of contents and every index at the end of the book. He browsed through the color-coded, colorful pictures, diagrams, and figures.

Over three years he took over 100,000 JPEGs. He then began his project, finally putting about 600 of them on his wall in an 8-foot by 9-foot mural. That mural is described in the 3,543-page book. The seventy-two-panel wall and the sentence “The thread is sulfur” are at page 90.

The method came from storyboarding and screenplay writing. A screenplay is built by asking who, what, where, when, how and why of every scene until the scene holds together or shows you it does not. Berger put the same questions to the literature. The Companion is the result, and the octave loop is the instrument.

The work is released openly. Berger wants the next wave of young scientists to have something new to explore. The book is not a monument to a finished argument. It is a working surface, built so somebody who was not there for any of it can come in cold, ask a question, and be handed both the answer and the place where the answer runs out. The second half of that is the gift.

Status. This manual accompanies NovagonDNA_Combined_Master_v332.pdf, 3,543 pages, 2,680 numbered sections, 143,720 internal links, deposited at Zenodo under concept DOI 10.5281/zenodo.23827226 and mirrored at github.com/drjab699-jab/scientific-arc. Open for distribution under CC BY 4.0.
